Part V. HIV Immunology References	1073
--	-------------

Preface

Scope and purpose of the HIV molecular immunology database

HIV Molecular Immunology 2005 is an annual companion volume to *HIV Sequence Compendium*. This publication, the 2005 edition, is the printed version of the web-based HIV Immunology Database (<http://www.hiv.lanl.gov/content/immunology/>). The web interface for this relational database has many search options, as well as interactive tools to help immunologists design reagents and interpret their results. We summarize through the previous year's literature, so *HIV Molecular Immunology 2005* has entries through the end of 2004. (There is no *HIV Molecular Immunology 2004*, because we skipped it to make the year in the title match the year of publication.)

In the HIV Immunology Database, HIV-specific B-cell and T-cell responses are summarized and annotated. Immunological responses are divided into three parts, CTL, T helper, and antibody. Within these parts, defined epitopes are organized by protein and binding sites within each protein, moving from left to right through the coding regions spanning the HIV genome. We include human responses to natural HIV infections, as well as vaccine studies in a range of animal models and human trials. Responses that are not specifically defined, such as responses to whole proteins or monoclonal antibody responses to discontinuous epitopes, are summarized at the end of each protein section. Studies describing general HIV responses to the virus, but not to any specific protein, are included at the end of each part.

The annotation includes information such as cross-reactivity, escape mutations, antibody sequence, TCR usage, functional domains that overlap with an epitope, immune response associations with rates of progression and therapy, and how specific epitopes were experimentally defined. Basic information such as HLA specificities for T-cell epitopes, isotypes of monoclonal antibodies, and epitope sequences are included whenever possible. All studies that we can find that incorporate the use of a specific monoclonal antibody are included in the entry for that antibody. A single T-cell epitope can have multiple entries, generally one entry per study.

Finally, maps of all defined linear epitopes relative to the HXB2 reference proteins are provided. Alignments of CTL, helper T-cell, and antibody epitopes are available through the search interface on our web site at <http://www.hiv.lanl.gov/content/immunology>.

Only responses to HIV-1 and HIV-2 are included in the database. CTL responses to SIVs have been periodically

summarized in our review section by Dr. Dave Watkins and colleagues. (For their most recent review, please see: Where Have All The Monkeys Gone? Evaluating SIV-Specific CTL in the Post-Mamu-A*01 Era, David H. O'Connor, Todd M. Allen, and David I. Watkins, in the 2001 HIV Immunology compendium). Dr. Christian Brander and colleagues annually provide a concise listing of optimal CTL epitopes. Additional reviews that our editorial board deems of general interest to the HIV research immunology community are solicited each year. This year's reviews are printed in the first part of this database; reviews from previous years can be found at <http://www.hiv.lanl.gov/content/hiv-db/REVIEWS/reviews.html>.

Comments on the database or requests for the hard copy can be sent via email to immuno@lanl.gov.

Citing the database

This publication may be cited as

HIV Molecular Immunology 2005. Bette T. M. Korber, Christian Brander, Barton F. Haynes, Richard Koup, John P. Moore, Bruce D. Walker, and David I. Watkins, editors. Publisher: Los Alamos National Laboratory, Theoretical Biology and Biophysics, Los Alamos, New Mexico. LA-UR 06-0036.

About the cover

This is a photograph of a young sooty mangabey named Siva taken in the Taï forest. The Taï National Park is situated in the southwest of the Ivory Coast. Sooty mangabeys harbor an SIV related to the human HIV-2 epidemic (see Santiago *et al.*¹). The photograph was generously donated to the immunology data-

¹M. L. Santiago, F. Range, B. F. Keele, Y. Li, E. Bailes, F. Bibollet-Ruche, C. Fruteau, R. Noë, M. Peeters, J. F. Brookfield, G. M. Shaw, P. M. Sharp, & B. H. Hahn, 2005. Simian immunodeficiency virus infection in free-ranging sooty mangabeys (*Cercocebus atys atys*) from the Taï Forest, Côte d'Ivoire: Implications for the origin of epidemic human immunodeficiency virus type 2. *J Virol* **79**(19):12515-12527

base by the photographer, Florian Möllers², and was taken in the context of the Tāi Monkey Project, which is associated with the Centre Suisse de Recherches Scientifiques (CSRS) in Abidjan³.

Our thanks to Ronald Noë, Florian Möllers, and Beatrice Hahn for making this cover possible.

About the PDF

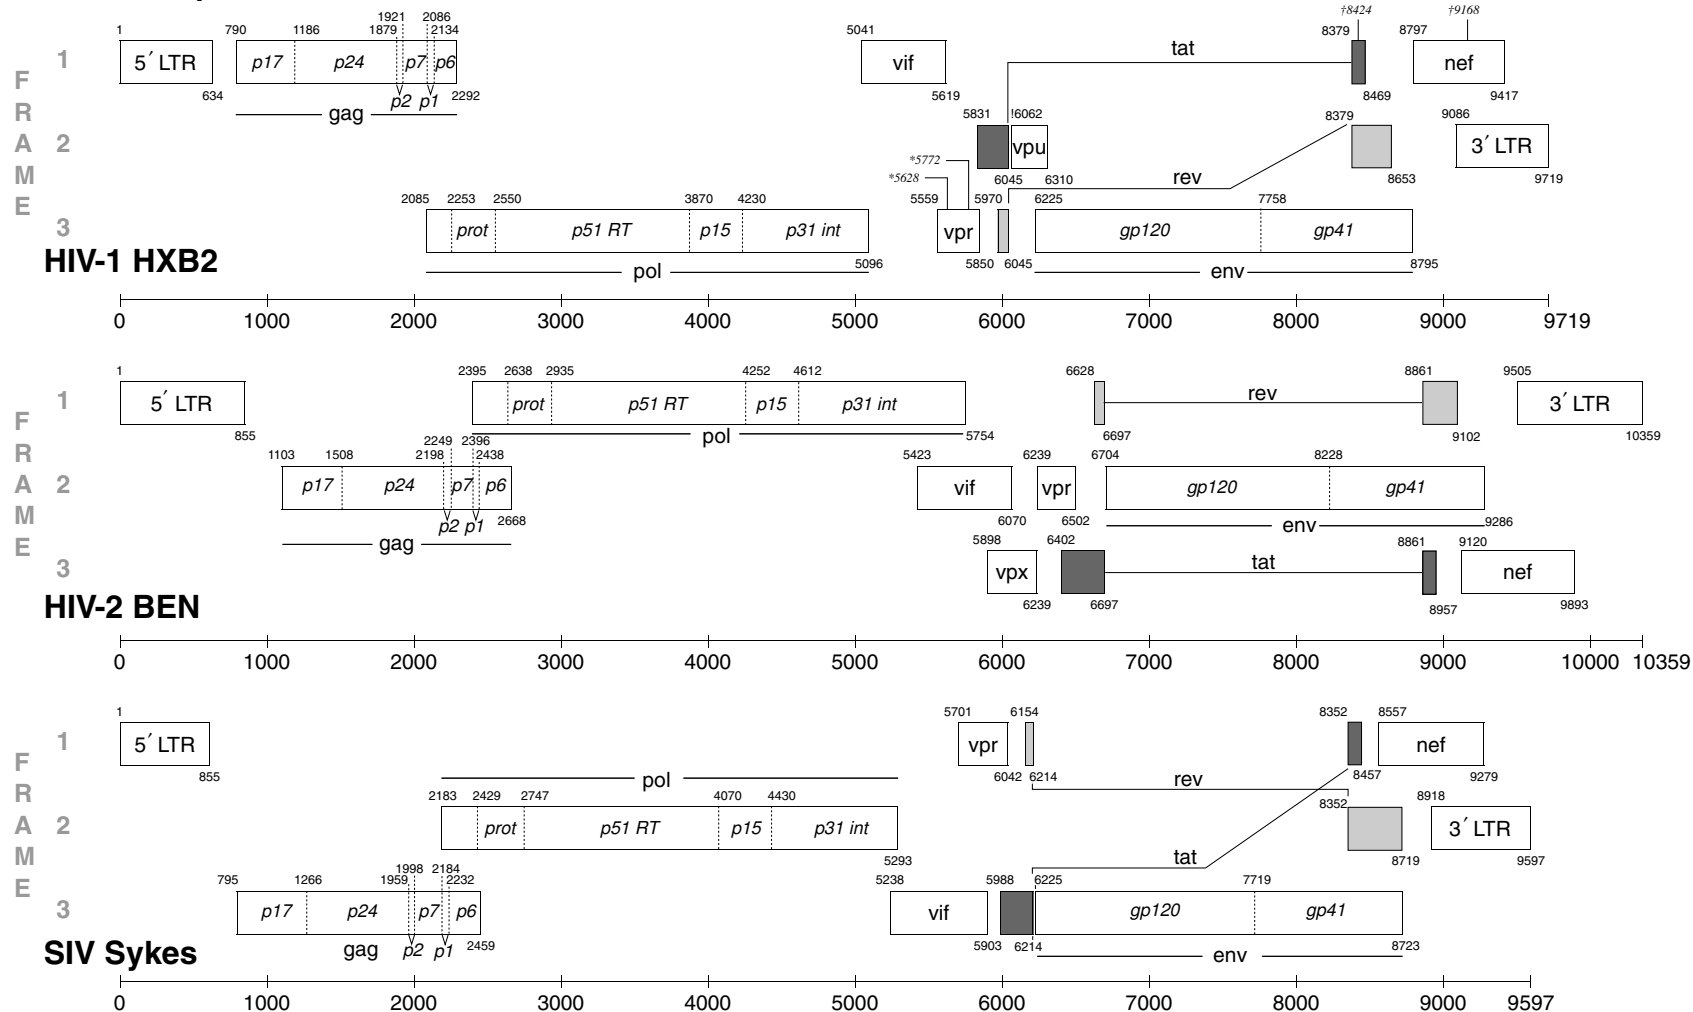

The complete *HIV Molecular Immunology 2005* is available in Adobe Portable Document Format (PDF) from our website, <http://www.hiv.lanl.gov/content/immunology>. The PDF version is hypertext enabled and features 'clickable' table-of-contents, indexes, references and links to external web sites.

This volume is typeset using L^AT_EX. The immunology data tables and epitope maps are produced automatically from the SQL database by a series of Perl programs.

³<http://www.orn.mpg.de/~knauer/noe/noe.html>

Genome maps

Landmarks of the HIV-1, HIV-2, and SIV genomes. The gene start, indicated by the small number in the upper left corner of each rectangle, normally records the position of the a in the atg start codon for that gene while the number in the lower right records the last position of the stop codon. For *pol*, the start is taken to be the first t in the sequence ttttttag which forms part of the stem loop that potentiates ribosomal slippage on the RNA and a resulting -1 frameshift and the translation of the Gag-Pol polypeptide. The *tat* and *rev* spliced exons are shown as shaded rectangles. In HXB2, *5628 and *5772 mark positions of frameshifts in the *vpr* gene; !6062 indicates a defective acg start codon in *vpu*; †8424 and †9168 mark premature stop codons in *tat* and *nef*. See Korber *et al.*, Numbering Positions in HIV Relative to HXB2CG, in *Human Retroviruses and AIDS*, 1998, p. 102. Available from <http://www.hiv.lanl.gov/content/hiv-db/REVIEWS/HXB2.html>

HIV/SIV proteins

Name	Size	Function	Localization
Gag MA	p17	membrane anchoring; env interaction; nuclear transport of viral core (myristylated protein)	virion
CA	p24	core capsid	virion
NC	p7	nucleocapsid, binds RNA	virion
	p6	binds Vpr	virion
Protease (PR)	p15	gag/pol cleavage and maturation	virion
Reverse Transcriptase (RT)	p66, p51	reverse transcription	virion
RNase H	(heterodimer)	RNase H activity	virion
Integrase (IN)		DNA provirus integration	virion
Env	gp120/gp41	external viral glycoproteins bind to CD4 and chemokine co-receptors	plasma membrane, virion envelope
Tat	p16/p14	viral transcriptional transactivator	primarily in nucleolus/nucleus
Rev	p19	RNA transport, stability and utilization factor (phosphoprotein)	primarily in nucleolus/nucleus shuttling between nucleolus and cytoplasm
Vif	p23	viral infectivity factor, inhibits minus-strand viral DNA hypermutation	cytoplasm (cytosol, membranes), virion
Vpr	p10-15	promotes nuclear localization of preintegration complex, inhibits cell division, arrests infected cells at G2/M	virion nucleus (nuclear membrane?)
Vpu	p16	promotes extracellular release of viral particles; degrades CD4 in the ER; (phosphoprotein only in HIV-1 and SIVcpz)	integral membrane protein
Nef	p27-p25	CD4 and class I downregulation (myristylated protein)	plasma membrane, cytoplasm, (virion?)
Vpx	p12-16	Vpr homolog present in HIV-2 and some SIVs, absent in HIV-1	virion (nucleus?)
Tev	p28	tripartite tat-env-rev protein (also named Tnv)	primarily in nucleolus/nucleus

Abbreviations

Common abbreviations and acronyms used in this database.

Abbrev.	Meaning
AA	amino acid
AAV	adeno-associated virus
Ab	antibody
ACTG	AIDS clinical trial group
ADC	AIDS dementia complex
ADCC	antibody-dependent cell-mediated cytotoxicity
ADE	antibody-dependent enhancement
ADRA	Antiviral Drug Resistance Analysis: a program that analyzes your sequences for mutations known to confer drug resistance and links to the records in the database
AIDS	acquired immunodeficiency syndrome
ANN	artificial neural networks
anti MHC	anti major histocompatibility complex
APC	antigen presenting cell
ARC	AIDS related complex
ART	anti-retroviral therapy
AZT	azidothymidine
BIMAS	BioInformatics and Molecular Analysis Section
BIV	bovine immunodeficiency virus
BLAST	Basic Local Alignment Search Tool
CAEV	caprine arthritis/encephalitis virus
CD4BS	CD4 binding site
CD4i	antibody that has enhanced binding to gp120 in the presence of SCD4 (CD4 induced)
CDC	Centers for Disease Control and Prevention
CDR	complementary determining regions
CFA	complete Freund's adjuvant
CHI	Center for HIV Information
CMI	cell-mediated immunity
CMV	cytomegalovirus
CNS	central nervous system
CP	canary pox
CRF	circulating recombinant form
CsA	cyclosporine A
CSF	cerebrospinal fluid
CTL	cytotoxic T lymphocyte
CTL _e	CTL effector
CTL _p	CTL precursor
CyPA	cyclophilin A
DC	dendritic cell
DDDP	DNA-dependent DNA polymerase
DHH	U. S. Department of Health and Human Services
dMM	deopymannojirimycin
dpc	days post challenge
DTT	dithiothreitol

Abbrev.	Meaning
EIA	enzyme immuno assay
EIAV	equine infectious anemia virus
ELF	Epitope Location Finder
ELISA	Enzyme Linked ImmunoSorbent Assay
ER	endoplasmic reticulum
Fabs	fragment antigen binding-univalent antibody fragment
FASTA format	Fast Alignment Search Tools Anything
FIV	feline immunodeficiency virus
FP	fowl pox
FSW	female sex worker
GALT	gut-associated lymphoid tissues
GDE format	Genetic Data Environment
gp	glycoprotein
GRIV	genetic resistance to HIV
HAART	highly-active anti-retroviral therapy
HCV	hepatitis C virus
HEPS	HIV-exposed persistently seronegative
HIV	human immunodeficiency virus
HIVD	HIV-1 dementia
HLA	human leukocyte antigens
HLA-MHC	human leukocyte antigens-major histocompatibility complex
HMM	hidden Markov models
IAVI	International AIDS Vaccine Initiative
IE genes	immediate early genes
IFA	incomplete Freund's adjuvant
IFN	interferon
IG format	IntelliGenetics format
Ig	immunoglobulin
IL	interleukin
INHI	immunologically normal HIV-infected
iscom	immunostimulating complex
KLH	keyhole limpet hemocyanin
LANL	Los Alamos National Laboratory
LDA	limiting dilution assay
LN	lymph node
LPR	lymphoproliferative response
LT	labile enterotoxin
LTMP	long-term non-progressor
LTR	long terminal repeat
LTS	long term survivor
mAb	monoclonal antibody
MBL	mannose-binding lectin
MCMC	Markov chain Monte Carlo
MDP	muramyl dipeptide
MEI	multiple epitope immunogen
MHC	major histocompatibility complex
MHR	major homology region
ML	maximum likelihood
MLV	murine leukemia virus
MP	maximum parsimony
mpc	months post challenge

Abbrev.	Meaning
MRC	Medical Research Council, UK
MSF	multiple sequence alignment format of the GCG sequence analysis package
MV	measles vector
MVA vector	modified vaccinia virus Ankara
Nab	neutralizing antibody
NCBI	National Center for Biotechnology Information
NIAID	National Institute of Allergies and Infectious Diseases
NIBSC	National Institute for Biological Standards and Control, UK
NIH	National Institutes of Health
NIST	National Institute of Standards and Technology
NJ	neighbor joining
NLS	nuclear localization signal
NRP	non-rapid progressor
NSI	non-synctium-inducing
p	protein
PB	peripheral blood
PBL	peripheral blood lymphocyte
PBMC	peripheral blood mononuclear cell
PCOORD	principal coordinate analysis
PCR	polymerase chain reaction
PERV	porcine endogenous retrovirus
PHYLIP	Phylogeny Inference Package
PL	proteoliposome
RAC	ricin A chain
RDDP	RNA-dependent DNA polymerase
rec/r	recombinant
RIP	Recombinant Identification Program: a program for detecting evidence of inter-subtype recombination
RIPA	Radio Immuno Precipitation Assay
RP	rapid progressor
RRE	Rev-responsive element
rsgp160	recombinant soluble gp160
RSV	Rous sarcoma virus
SAM	Sequence Alignment and Modeling program
SAP	sequential antigen panning
sCD4	soluble CD4
scFv	single-chain variable fragment
SDS	sodium duodecyl sulfate
SFV	Semliki Forest virus
SI	synctium inducing
SIV	simian immunodeficiency virus
SIVE	SIV encephalitis
SNAP	synonymous-nonsynonymous analysis program

Abbrev.	Meaning
STI	supervised treatment interruption (also seen as structured treatment interruption and standard treatment interruption)
TCLA	T cell line adapted
TCR	T-cell receptor
Th	T-helper cell
TNF	tumor necrosis factor
VEE	Venezuelan equine encephalitis
VESPA	Viral Epidemiology Signature Pattern Analysis
VIP	vasoactive intestinal peptide
VL	viral load
VLP	virus like particle, assembled from p55 gag
VSV	vesicular stomatitis virus
VV	vaccinia virus
WB	Western Blot

Amino Acid Codes

A	Alanine
B	Aspartic Acid or Asparagine
C	Cysteine
D	Aspartic Acid
E	Glutamic Acid
F	Phenylalanine
G	Glycine
H	Histidine
I	Isoleucine
K	Lysine
L	Leucine
M	Methionine
N	Asparagine
P	Proline
Q	Glutamine
R	Arginine
S	Serine
T	Threonine
V	Valine
W	Tryptophan
X	unknown or "other" amino acid
Y	Tyrosine
Z	Glutamic Acid or Glutamine
.	gap
-	identity
\$	stop codon
#	frameshift

I-A

Optimal CTL Epitope Identification in HIV Clade B and Non-Clade B Infection

Nicole Frahm^a, Christian Brander^a

I-A-1 T cell immunity in HIV infection

HIV specific cytotoxic T lymphocytes (CTL) and T-helper cells (Th) remain one of the cornerstones of a potential HIV vaccine, and a number of vaccine trials and recent *in vitro* studies point towards the importance of the close interplay between these two arms of the cellular immune response in HIV infection. As more and more vaccine candidates find their way to clinical trials, not only the question of vaccine immunogen selection but also that of the appropriate *in vitro* monitoring of vaccine success become increasingly critical issues. The chosen approaches will need to balance the optimal sensitivity with the need of inter-trial comparability, and several efforts are under way to establish widely applicable *in vitro* antigen test sets to monitor several parallel vaccine trials in the future. The challenge for this undertaking is considerable, given that many vaccine trials are based on non-clade B immunogens, and thus require a comprehensive knowledge of immunogenic regions in various HIV clades, with the most pressing one likely being clade C. Part of this characterization will be the detailed delineation of the optimal CTL epitopes and their HLA restriction that are contained in these regions, so that reliable predictions can be made in terms of population coverage and how well local viral diversity is reflected by the vaccine sequence(s). Thus, although few laboratories nowadays follow through on identifying the precise nature of the targeted, optimal CTL epitopes in their various immunogens, we feel that epitope definition is not only desirable but actually urgently needed for an optimal vaccine design and appropriate analyses of induced responses. As in the past years, we here present an updated compilation of optimally defined CTL epitopes in all regions of HIV, which increasingly also includes epitopes defined in non-clade B infection. As argued above, especially non-clade B derived CTL epitopes will be most

useful in refining vaccine approaches in the future and we thus include annotations to the epitopes indicating the test sequence used to identify the epitope. We feel that both of these additional pieces of information are important considerations as they can profoundly impact the detection rate of responses *in vivo* and obviously need to be included in vaccine immunogen design as well.

I-A-2 Escape from CTL recognition and antigen processing

Aside from sequence differences between various HIV clades, much focus has been given over the last few years to sequence variability within defined optimal epitopes as well as to regions in close proximity of such well-defined epitopes. Changes within the epitope are generally interpreted as CTL escape variants that either modulate binding to the HLA molecule or which reduce the binding affinity to the cognate T cell receptor [Brander *et al.*, 1998; Leslie *et al.*, 2004]. On the other hand, changes flanking the epitope, (as well as within) have been shown to interfere with efficient antigen processing, thereby also affording escape from CTL surveillance [Allen *et al.*, 2004; Draenert *et al.*, 2004b]. While CTL escape by changes within the targeted epitope has been well documented and used to link HIV evolution and host genetics [Moore *et al.*, 2002], the importance of processing escape is still unclear. However, processing may represent an effective escape route as no variant-specific CTL responses can be generated after escape has occurred. By inference from large-genome herpesviruses, which often have dedicated multiple genes towards interfering with antigen processing [Brander & Walker, 2000], this strategy seems to be a successful one and it is feasible that the highly variable HIV genome provides ample opportunities for this kind of immune evasion. This is different when escape occurs within the epitope and the epitope is still processed and presented. Except in cases of escape mutation in dominant anchor positions, these changes may mediate escape from TCR recognition but still bind to the restricting allele, thus allowing for the induction of a new population of CTL responses against the escaped variant [Allen *et al.*, 2005; Haas *et al.*, 1996]. Further work will need to be done to assess the frequency and relevance of processing escape, but existing and in

In *HIV Molecular Immunology 2005*. Bette T. M. Korber, Christian Brander, Barton F. Haynes, Richard Koup, John P. Moore, Bruce D. Walker, and David I. Watkins, editors. Publisher: Los Alamos National Laboratory, Theoretical Biology and Biophysics, Los Alamos, New Mexico. LA-UR 06-0036. p. 3–20.

some cases quite dramatic examples of TCR and/or HLA binding escape should not conceal this potential strategy. In addition, processing escape will or may already have influenced global viral evolution in different ways than CTL escape as other, likely more limited genetic polymorphisms (TAP for instance) may be imprinted on the viral sequences. These considerations can have profound implications for vaccine development and may complicate immunogen sequence design considerably, and the discrimination between processing and CTL escape depends on an accurate description of the actual presented epitopes.

I-A-3 Are “relic” epitopes on the rise?

Adaptation of (viral) pathogens to the human host has been well documented in the past and intensively studied for HIV. Work by a number of laboratories has pointed towards an important role of HLA class I polymorphism and viral evolution, presumably through viral adaptation to HLA class I restricted CTL responses [Altfeld *et al.*, 2005; Leslie *et al.*, 2005; Moore *et al.*, 2002]. A number of studies have in the meantime identified populations with particularly high frequencies of specific HLA class I alleles and associated specific local sequences with escape from CTL epitopes restricted by these common HLA alleles. Such studies include HLA-B57 positive individuals in South Africa, HLA-A24 expression subjects in the Japanese population and others that have been used to track potential CTL epitopes by reverse genetic approaches [Allen *et al.*, 2004; de Oliveira *et al.*, 2004; Furutsuki *et al.*, 2004; Leslie *et al.*, 2005]. Furthermore, in a recent work from our laboratory, population wide adaptation may even have rendered an HLA allele, in this case HLA-B*1503, from being associated with reduced viral load in a population with low allele frequency to an allele associated with higher than average viral load in the population where it is overly frequent [Frahm *et al.*, 2005b]. However, the kinetics of such population wide adaptation and possible founder effects need to be seriously considered when interpreting these data as similar sequence patterns may emerge in population that do not share specific high frequency alleles [Korber *et al.*, 2005]. Regardless of whether founder effects may, at least partially, be responsible for the observed imprinting, high allele frequencies very likely facilitate the maintenance of escape variants and bear the question as to whether CTL responses restricted by common HLA alleles can be of significant importance for *in vivo* viral control [Lieberman, 2002]. As viral adaptation to any CTL pressure, including that restricted by common alleles, may result in reduced viral fitness and thus reduced *in vivo* viral burden, CTL responses restricted by common alleles may indeed contribute to viral control [Brander & Walker, 2003]. Despite frequent reversion of escaped CTL epitopes in hosts not expressing the restricting allele, espe-

cially CTL epitopes restricted by common alleles may be eliminated from the circulating viral population. Inclusion of such “relic” epitopes in vaccine design may for obvious reasons not provide much protection from infection by contemporary, circulating viral isolates and highlights again the need to have well defined epitope maps available for all clades of HIV.

As in the past years, we attempted to adhere for the present listing to a number of criteria that need to be fulfilled for inclusion [Brander & Walker, 1995; Hunziker *et al.*, 1998]. While these criteria should help to ensure proper identification of the minimal epitope targeted at the lowest peptide concentration and provide unequivocal identification of the restricting HLA class I allele, there may still be occasions where the data reported here conflict with data in other laboratories. We would like to encourage any investigator who observes discrepancies in his/her own data with what is reported here to bring this to our attention. Especially, we have reported earlier on cases of epitopes that appear to be presented on more than one allele; a phenomenon that may be more widespread than previously assumed and which may profoundly complicate data interpretation. Such information on additional presenting alleles can be highly useful for other investigators and we would welcome any contribution of this kind. Similarly, as newly identified epitopes may violate known HLA binding motifs or may be embedded in previously described epitope sequences, properly mapped epitopes may help to refine currently incompletely defined allele-specific binding motifs, thereby not only facilitating work in HIV but in other viral infections, cancer and autoimmunity as well.

I-A-5 Acknowledgments

Finally, we would like to express our gratitude to those researchers in the field who continuously contribute to this database. The data added to this years update stemming from the AIDS Research Center at Mass. General Hospital have been largely funded by an NIH contract (#NO1-A1-15442) supporting HLA typing and HIV CTL epitope definition in non-Caucasian populations and non clade B HIV infection.

We very much welcome any criticism, comments and additions to this list since we are sure that some epitopes will unintentionally escape our attention, despite close monitoring of the literature. Please write or call us with any comments you may have at:

Acute HIV Infection: Implications for HIV Spread, Disease Progression, and Vaccine Development

Myron S. Cohen^{a,b,c}, Jeffrey A. Anderson^{a,b},
Ronald Swanstrom^{a,c,d}

I-B-1 Acute HIV infection and its detection

The natural history of initial HIV infection can be arbitrarily divided into phases that include acute HIV infection, the first stage of disease (when HIV RNA can be detected in blood) before most HIV-specific antibodies form; recent or early infection, when antibodies in reduced concentration or reduced avidity can be detected; and established chronic HIV infection (Figure I-B.1 [Fiebig *et al.*, 2003; Pilcher *et al.*, 2004a]). Finding patients before seroconversion is critical to understand the HIV transmission event(s) effects and the effect(s) of host defenses on the viral population.

Figure I-B.1: Acute/early HIV infection timeline.

In *HIV Molecular Immunology 2005*. Bette T. M. Korber, Christian Brander, Barton F. Haynes, Richard Koup, John P. Moore, Bruce D. Walker, and David I. Watkins, editors. Publisher: Los Alamos National Laboratory, Theoretical Biology and Biophysics, Los Alamos, New Mexico. LA-UR 06-0036. p. 21–31.

It is generally believed that half or more of patients with acute or early HIV infection may develop a “mono-like illness” [Schacker *et al.*, 1996; Lavreys *et al.*, 2000; Pilcher *et al.*, 2005]. Patients with acute HIV can present either for acute symptomatic care [Schacker *et al.*, 1996], for care of sexually transmitted disease (STD) symptoms [Pilcher *et al.*, 2005], or (realizing their elevated risk) for HIV testing. Although the diagnosis is rarely considered in acute patient care or testing settings, the potential for diagnosis is clearly present. For example, Rosenberg *et al.* [1999] reported that 1.0% of patients with negative tests for EBV (Epstein-Barr virus) infectious mononucleosis had serology consistent with acute HIV infection, and Pincus *et al.* [2003] found that 1.0% of patients with “any viral symptoms” in a Boston urgent care center had unsuspected acute HIV infection. However, searching for symptomatic subjects is a relatively inefficient strategy to detect subjects with acute or early HIV infection. For example, Rosenberg *et al.* found only about 150 subjects over 8 years [Kassutto *et al.*, 2005].

Alternative approaches involve “building a cohort” or longitudinal evaluation. The cohort approach requires enrollment of high risk, HIV seronegative subjects. For example, Lavreys *et al.* [2000] followed 883 female sex workers for up to five years at three month intervals. A total of 103 seroconversion events were observed. Fever, vomiting, diarrhea, headache, joint pain, body aches, skin rash, lymphadenopathy, fatigue and pharyngitis were more common among women who seroconverted. However, these patients were virtually all beyond the acute (antibody negative) phase of infection at the time of study.

Cross-sectional studies appear to offer the best strategy to find subjects before seroconversion. This approach was developed to make the blood supply safe, albeit at considerable cost [Ruiz *et al.*, 2001]. Recognizing that traditional antibody tests would inevitably miss some donors, blood banks in the United States and many other countries chose to eliminate infected (seronegative units) units with detection of HIV RNA [Engelfriet & Reesink, 2002; Roth & Seifried, 2002; Fang *et al.*, 2003; Mine *et al.*, 2003; Fiebig *et al.*, 2003; Koppelman *et al.*, 2005]. Bollinger *et al.* [1997] studied seronegative HIV in high risk sub-

jects in India. Among 6,495 consecutive attendees at two STD clinics in Pune, p24 antigen was detected in 58/3,874 (1.5%) of HIV seronegative samples. The majority of subjects with acute infection (51/58) were men. A group of 290 controls were matched on age and gender and compared for clinical signs of acute HIV infection. The most common symptoms associated with p24 antigenemia were fever, joint pain, inguinal lymphadenopathy, and night sweats; at least one of these symptoms was found in 47% of those with acute HIV infection.

Figure I-B.2: HIV-1 infections by testing site.

A series of studies have been completed that are designed to detect HIV RNA in blood in a large number of samples, using a serum pooling strategy adapted from the blood banking industry [Pilcher *et al.*, 2002, 2004b, 2005]. In North Carolina nearly 110,000 people seeking HIV testing were studied [Pilcher *et al.*, 2005]. A total of 563 people with established HIV infection were identified. A “detuned” ELISA assay designed to detect newly formed antibodies suggested 103 recent infections in the group of 563. Among HIV antibody negative specimens, 23 with HIV RNA (i.e., acute HIV infection) were detected. As shown in Figure I-B.2 most subjects with acute infection were detected in STD clinics. The median blood viral burden of subjects with acute HIV infection was 209,000 copies/ml, ten times greater than subjects with established infection.

These findings have led to increased focus on STD clinic subjects in developing countries [Pilcher *et al.*, 2004b]. As shown in Figure I-B.3, a group of 1360 men in an STD clinic in Lilongwe, Malawi were studied, and a total of 553 (40.6%) were HIV antibody positive. Analysis of HIV antibody negative specimens revealed that 24 men (1.8%) had unrecognized acute HIV infection, which represented 5.0% of all HIV infections detected. The factor most strongly associated with detection of acute HIV was attendance in the STD clinic [OR: 15.2 (95% CI: 2.04, 113.0)]. Patients with acute HIV infection had median blood viral burden > 10⁶ copies/ml, significantly higher than the 10^{4.5} copies/ml median observed in chronic infections (Figure I-B.3).

These results have recently been confirmed [Fiscus *et al.*,

Figure I-B.3: Viral load in Malawi: chronic and acute HIV infection

2005]. Among 1440 men and women studied in Malawi, 8% had established HIV infection and 1% (22 subjects) had acute infection. A heat-dissociated p24 antigen ELISA (see below) discerned 84% of the subjects with acute HIV infection. Of 1906 consecutive clinic attendees (47% female) recruited in the Hillbrow, Esselen Street STD Clinic in Johannesburg, SA, from April through October 2004 [Stevens *et al.*, 2005], a total of 672 individuals were HIV antibody positive (35.2%). In addition, 12 subjects (1% of antibody negative subjects) were HIV RNA positive (with acute HIV infection).

I-B-2 The importance of acute HIV infection

Detection of subjects with acute HIV infection raises three related concerns: i) implications for HIV surveillance; ii) opportunities to change the natural history of the disease; iii) opportunities for prevention of transmission.

Implications for HIV surveillance

Established HIV infection is detected by antibody testing. In recent years a variety of assays have been developed to detect antibodies with reduced concentration or avidity that are believed to reflect early (incident) infection [Janssen *et al.*, 1998; Brust *et al.*, 2000; Stramer *et al.*, 2000; Glynn *et al.*, 2000; Chen *et al.*, 2002; Stramer *et al.*, 2004]. The precise relationship between the time of infection and the veracity of these assays is difficult to assure, but current evidence suggests that positive results are obtained for at least several months after infection. Obviously, acute (truly incident) infections are not detected with antibody testing so the results of the cross-sectional methods applied to the general population are complementary, and can be quite

important if a substantial number of subjects are identified [Pilcher *et al.*, 2005].

Implications for treatment

The earliest stages of HIV infection reflect a battle between viral replication and emerging host defenses. The magnitude of the viral burden when the “set point” is reached will help to determine the natural history of the diseases [Mellors *et al.*, 1996]. In addition, results from animals and humans demonstrate considerable destruction of gut lymphoid cells during the earliest weeks of HIV infection [Lifson *et al.*, 2003; Guadalupe *et al.*, 2003; Brenchley *et al.*, 2004]. Accordingly, there has been great interest in early treatment of HIV. However, to date no sustained benefit of such therapy has been observed [Klein, 2001; Gegeny, 2002; Clements *et al.*, 2003; Kaufmann *et al.*, 2004; Di Mascio *et al.*, 2004; Smith *et al.*, 2004; Hammer, 2005]. Newer trials are focused on patients with acute or very early infection, and the concomitant application of antiviral drugs and agents that affect the cell cycle and/or state of cellular activation.

Implications for transmission prevention

The efficiency of HIV transmission depends on the viral burden [Quinn *et al.*, 2000] and the viral phenotype. The great viral burden characteristic of acute HIV infection virtually assures increased transmission risk [Pilcher *et al.*, 2004c]. In addition, many people with acute HIV infection have untreated STDs [Pilcher *et al.*, 2004b] which further increase genital tract viral shedding [Cohen *et al.*, 1997]. Mathematical modeling exercises have predicted that subjects with acute infection could play a disproportionate role in the epidemic. Jacquez *et al.* [1994]; Koopman *et al.* [1997] and recent analysis of data from Uganda [Koopman *et al.*, 1997] provide compelling support for this idea. Wawer *et al.* [2005] estimated the probability of HIV transmission from a subject with “early infection” (measured an average of 2.5 months after seroconversion) as 8.2/1000 episodes of intercourse, with established infection as 7–15/10,000, and with advanced (unrestrained and untreated) infection as 2.8/1000. The authors estimated that 43% of new HIV infections observed in their study population could be ascribed to subjects with acute and early infections.

I-B-3 Clades and transmission

The viral burden represents only a part of the story. The genotype and phenotype of the viral population must also play a crucial, albeit poorly understood role.

A key feature of HIV-1 is its genetic heterogeneity represented by distinct subtypes (A–K) [von Briesen *et al.*, 1990; Leitner *et al.*, 2004]. The HIV-1 clades or subtypes are

not equally distributed around the globe, with subtype C representing approximately one-half of all infections. The existence of these phylogenetic clades likely represents an early isolation or bottleneck to establish subepidemics out of a more diverse initial epidemic. In areas of cocirculating subtypes, recombinants are common, suggesting there is no genetic barrier that has isolated the subtypes. There has been widespread interest in the possibility that the subtypes have different biological properties. A study by Devito *et al.* [2002] suggests a differential response in neutralizing antibodies in seronegative individuals exposed to clades A and D vs. clade B. IgA purified from the blood and genital tract from sex workers from Nairobi and Kenya, wherein clades A and D predominate, demonstrated significant cross-clade HIV-1 neutralization. In contrast, a more clade-specific pattern of neutralization was found in non-infected sex partners of clade B individuals. In addition, one study that indicated subtype C isolates have reduced replicative capacity in cell culture relative to subtype B isolates [Ball *et al.*, 2003] runs counter to the world-wide success of the subtype C virus, suggesting simple correlations between *in vitro* measures of biology and subtypes may be problematic.

One difference that has been widely reported is that subtype C HIV-1 appears to be less likely to undergo a coreceptor switch from using CCR5 to using CXCR4 [Tscherning *et al.*, 1998; Abebe *et al.*, 1999; Bjorndal *et al.*, 1999; Ping *et al.*, 1999; Cecilia *et al.*, 2000; Morris *et al.*, 2001]. Since most transmission events involve an R5 virus, this might suggest subtype C HIV-1 has an advantage in the rate of transmission over subtypes that could have their R5 pool diluted with X4 viruses. However, the site of the block of transmission of X4 viruses is not known, if indeed there is one, so that the potential impact of this subtype difference is hard to evaluate.

Others postulate that HIV-1 clade C could theoretically be more genetically fit than other clades due to an increased number of NF κ B sites (up to 3 in clade C) within the long terminal repeat which could enhance proviral DNA transcription [Montano *et al.*, 2000]. More direct indications of potential differences between subtypes are suggested by the detection of subtype C viral sequences, but not subtype A viral sequences, in vaginal secretions of a person coinfecting with subtype C and subtype A viruses [Iversen *et al.*, 2005] and higher rates of vertical transmission of subtype C HIV-1 compared to subtypes A or D [Renjufi *et al.*, 2004], as well as higher rates of nevirapine resistance in women with subtype C vs. A or D after treatment with single-dose nevirapine [Eshelman *et al.*, 2005]. Taken together, these data suggest that different HIV clades may alter disease progression and pathogenesis.

I-B-4 The transmitted swarm

HIV-1 exists as a complex mixture of genotypic variants within an infected person. This complexity can be used to estimate the extent of the bottleneck that occurs during transmission. Early reports were conflicting as to whether the transmitted virus was homogeneous [Amedee *et al.*, 1995; Delwart *et al.*, 1994; Furuta *et al.*, 1994; Kliks *et al.*, 2000; McNearney *et al.*, 1993; Mulder-Kampinga *et al.*, 1993; Ou *et al.*, 1992; Pang *et al.*, 1992; Shankarappa *et al.*, 1999; Sadora *et al.*, 1998; Wolfs *et al.*, 1992; Zhu *et al.*, 1993], suggesting a strong bottleneck; or heterogeneous [Delwart *et al.*, 1997; Dickover *et al.*, 2001; Enose *et al.*, 1997; Kampinga *et al.*, 1997; Lamers *et al.*, 1993; Learn *et al.*, 2002; Liu *et al.*, 1997; Nowak *et al.*, 2002; Pilcher *et al.*, 2001; Scarlatti *et al.*, 1993; Sutthent *et al.*, 1998; Verhofstede *et al.*, 2003; Wolinsky *et al.*, 1996; Zhu *et al.*, 1996], suggesting the transmission of multiple variants [Rademeyer *et al.*, 2004; Ritola *et al.*, 2004].

Interest in this area was renewed with the report that with heterosexual transmission women are frequently infected with multiple variants while men are typically infected with a single variant [Long *et al.*, 2000]. This study was extended to detect transmission of multiple variants for several other subtypes, although in smaller studies [Sagar *et al.*, 2003]. Moreover, genital tract infections have been estimated to increase the risk of acquiring multiple vs. single variants nearly five fold in women [Sagar *et al.*, 2004], possibly secondary to transmission of cell-associated virus with multiple proviruses. The detection of single variants in men was reported but in a cohort where the risk factor was not known [Delwart *et al.*, 2002]. Conversely, multiple variants were detected early after transmission in a homosexual male cohort but these variants became more homogeneous in the subsequent weeks [Learn *et al.*, 2002].

Finally, we have detected multiple variants in half of the men infected through homosexual exposure, suggesting that this mode of transmission may be more similar to the risk of women in heterosexual exposure than of men in heterosexual exposure [Ritola *et al.*, 2004]. The question of the number of transmitted variants is important to resolve for two reasons. First, the transmission of multiple variants is inconsistent with transmission being infrequent and a virus particle being the minimal infectious unit, suggesting fundamental features of the mechanism of transmission remain unknown. Second, longitudinal follow-up of women infected with single versus multiple variants showed that infection with multiple variants was associated with more rapid progression [Sagar *et al.*, 2003]. Thus, features of virus transmission and the impact of this earliest event in infection on the entire disease course remain important areas of study.

I-B-5 Features of the transmitted virus

A long-standing interest in the vaccine field has been to understand the nature of the transmitted virus as this is ultimately the entity that a vaccine must protect against. The null hypothesis is that the transmitted variant is simply a randomly selected subset of the total virus population in the donor. However, compartmentalization of the virus population in the genital tract secretions that carry the transmitted virus or early selection for specific variants in the newly infected recipient could alter the composition of the virus population in ways that might impact vaccine design.

Derdeyn *et al.* [2004] have reported that subtype C HIV-1 isolated from newly infected subjects in a discordant couple cohort have env genes that are largely homogeneous, encode Env proteins that are more neutralization sensitive than the Env proteins of the donor virus, and have shorter variable loop lengths in Env compared to the circulating virus in the donor. The hypothesis to explain these observations is that the recipient initially represents an antibody-negative environment that rapidly selects for variants that can grow more rapidly but at the expense of having an Env protein that is more neutralization sensitive.

Similar reduced V1/V2 loop length and reduced number of glycosylation sites were observed in heterosexual transmission of subtype A HIV-1 [Chohan *et al.*, 2005]. However, no such differences in neutralization sensitivity, variable loop length, or glycosylation site number have been seen for (largely homosexual) transmission of subtype B HIV-1 [Chohan *et al.*, 2005; Frost *et al.*, 2005]. It is not obvious how different subtypes or different modes of transmission could have such a dramatic impact on determining the nature of the transmitted variant. At present these questions remain unresolved yet relevant to our understanding of HIV transmission and early infection.

I-B-6 HIV compartmentalization and implications for transmission

Substantial research has focused on HIV-1 variation within anatomical compartments in acute and chronic HIV-1 infection; compartmentalization can occur in a variety of areas including plasma, brain, genital tract secretions, or within different leukocyte compartments [Zhu *et al.*, 1996; Eron *et al.*, 1998; Staprans *et al.*, 1999; Kiessling *et al.*, 1998; Haddad *et al.*, 2000; Gupta *et al.*, 2000; Venturi *et al.*, 2000; Pilcher *et al.*, 2001; Poles *et al.*, 2001; Sutthent *et al.*, 2001; Zhang *et al.*, 2002; Potter *et al.*, 2003; Kemal *et al.*, 2003; Tirado *et al.*, 2004; Ghosn *et al.*, 2004; Potter *et al.*, 2004; Philpott *et al.*, 2005; Ritola *et al.*, 2005; Smit *et al.*, 2004; Sullivan *et al.*, 2005; Adal *et al.*, 2005]. One of the first examinations of viral compartmentalization was done by Zhu *et al.* [1996], and examined envelope gp120 se-

quences in plasma and genital secretions of patients acutely infected with HIV-1, and their chronically-infected sexual partners. Envelope sequences from the acutely infected group were largely homogeneous, and represented a minor variant of the population found in the semen of the transmitting partner. These data provided the first evidence that HIV-1 selection may occur during sexual transmission. Further analysis of envelope gp120 sequences during acute infection revealed that variants transmitted during acute infection form the genetic basis for subsequent viral diversification that leads to heterogeneity in chronic infection [Zhang *et al.*, 2002]. Kemal *et al.* [2003] found that in a majority of women, gp120 sequences from the genital tract and plasma are distinct. Envelope gp120 glycosylation sites, which are hypothesized to form a protective shield and facilitate neutralization escape, were significantly different between the two compartments.

These studies suggest that compartmentalization observed in chronic infection is likely secondary to gradual viral evolution from a dominant species, rather than differential migration of variants to various anatomical locations during acute infection. To analyze the dissemination of HIV-1 into various anatomical compartments during primary infection, including plasma, cerebrospinal fluid (CSF), semen, cervicovaginal lavage fluid, and/or saliva in 17 individuals, Pilcher *et al.* [2001] confirmed that viral dissemination is highly efficient and dynamic, and concluded that antiretroviral therapy is unlikely to limit initial virus spread to most tissue compartments, although it may reduce genital tract shedding and central nervous system (CNS) expansion. In those subjects that are infected with multiple variants, these variants appear to penetrate the seminal compartment and CNS (CSF) equivalently [Ritola *et al.*, 2004].

In addition, there is growing evidence that the genital tract of both males and females can serve as a reservoir for drug resistance mutations: paired analyses of plasma and genital secretions in nine of twelve women exhibited different drug-resistance mutations [Tirado *et al.*, 2004]. A similar result was obtained in men, wherein the rate and pattern of emergence of resistance varied between plasma and semen [Eron *et al.*, 1998]. Additional phylogenetic analyses of clones of the HIV pro gene have revealed variants in semen that originate not only from passive diffusion from blood, but also from local production within semen [Ghosn *et al.*, 2004]. Additional studies to analyze the interplay between cellular, humoral, and viral factors involved in drug resistance and compartmentalization are critical to HIV pathophysiology and controlling the infection.

I-B-7 Resistance characteristics of the transmitted virus

Although highly active antiretroviral therapy (HAART) has significantly decreased morbidity and mortality from HIV, treatment remains problematic due to the development of resistance to antivirals and evasion of the host immune system. Blower *et al.* [2001] have identified several factors that may enhance the transmission of resistant virus: an increasing proportion of HIV-infected patients who are on antiviral therapy (increased probability of acquiring infection from treated person), an increasing rate at which patients on antiviral treatment develop drug resistance (dependent on potency, adherence, genetic barriers), an increasing relative fitness of the resistant strains (dependent on replicative capacity of the resistant strain), a decreased transmissibility of drug-sensitive strains from treated patients, and individual risk factors.

Surveillance of the transmitted variants is crucial to understanding these factors, rational drug use and vaccine development. Indeed, transmission of drug-resistant viruses has been the subject of intense scrutiny in the recent past and remains a significant public health concern. A series of prevalence reports from North America and Europe indicate the transmission of HIV-1 resistance is steadfastly increasing [Salomon *et al.*, 2000; Grant *et al.*, 2002; de Mendoza *et al.*, 2005; Yerly *et al.*, 2001; Little *et al.*, 2002] with measurements ranging from 3% to 23% for one or more drugs. Differences are at least in part due to study design, number of patients, resistance testing, definitions of resistance, geography, variability in antiviral selection, timeline, and risk factors for transmission. Although multiple studies have confirmed the increasing frequency of transmission of drug-resistant virus, these estimates may be an underestimate as the sequencing techniques for genotypic analysis did not quantify minor populations below 25%. To determine the prevalence of these minor variants, Metzner *et al.* [2005] have devised a quantitative real-time PCR assay using allele-discriminating oligonucleotides for three key resistance mutations, L90M (protease), K103N and M184V (RT). In 49 acute seroconverters in Germany from 1999 to 2003, overall drug resistant variants were detected in 20.4%. The L90M, K103N, and M184V were found in 2%, 10%, and 12%, respectively. Thus, knowledge of the prevalence of major and minor resistance variants may impact antiretroviral therapy.

Transmission of drug resistance mutations has been shown to affect disease outcome and response to antiviral treatment. Little *et al.* [2002] found that among subjects infected with drug-resistant virus, there was a significant delay in viral suppression after initiation of antiretroviral therapy (median of 88 days vs. 56 days). Moreover, even though there was no significant difference in mean

baseline plasma viral loads between the susceptible and resistant cohorts, once suppression was achieved the time to virological failure was significantly shorter in the patients infected with resistant virus (approximately 80% vs. 40%, respectively, remaining suppressed 500 days after achieving viral suppression). These data indicate that antiretroviral therapy is twice as likely to fail in patients infected with drug-resistant virus. In addition, drug-resistant HIV-1 isolates have been shown to persist in the host after primary infection without reversion to wild-type, even in the absence of drug therapy [Barbour *et al.*, 2004; Brenner *et al.*, 2002; Chan *et al.*, 2003; Delaunay *et al.*, 2004]. These data suggest that some drug-resistant mutants have altered genetic fitness. In addition, Turner *et al.* [2004] compared the incidence of HIV-1 variants containing resistance to thymidine analogues, RT inhibitors, and protease inhibitors in primary HIV and chronic HIV infection. M184V was found in early HIV infected patients significantly less than in the chronic (potential transmitter) HIV infected group, 10% vs. 70%, respectively. The reduced transmissibility of M184V in the potential transmitters may be secondary to reduced viremia (up to 0.8 log lower) or compartmentalization of variants lacking M184V.

I-B-8 Conclusions

Renewed interest has developed in acute and early infection in recent years. New strategies to identify subjects in acute infection in the course of standard HIV screening open the possibility of early intervention both to preserve immune function (early therapy) and to reduce transmission during this period of high infectiousness. Analysis of the transmitted virus has raised questions about the nature of the transmission event and about the earliest features of viral evolution with implications for vaccine design and disease progression. The study of acute infection will continue to extend our knowledge about the earliest response of the human host to the virus and its limitations that result in a failure to clear the virus. This knowledge will become the cornerstone of a new generation of vaccine strategies based on a deeper understanding of these earliest events of HIV-1 infection.

I-C-1 Introduction

Over the years the staff of the HIV databases have developed web-based software for working with HIV sequence data. This is a general overview of the tools that are available on the HIV database website. Many of these tools are very simple, and were developed because we wanted to ease frequently-used computational tasks for our colleagues who use the database.

Some tools are tailored for HIV or HCV, and have counterparts developed specifically for the HCV (<http://hcv.lanl.gov/>) or HIV (<http://hiv.lanl.gov>) databases. Others are general and can be used for analysis of any organism. A fast way to understand what these programs do is to click the “Sample Input” button on the input page. This causes an example input file to be loaded into the input page, so you can run the program to get an idea about what the output looks like.

I-C-2 Outline of HIV database tools

This part of this publication provides an outline of these programs organized by their functions. A short description of each tool is provided. If a tool can be applied to any sequence, not just HIV or HCV, it is labeled, “General,” while a tool that is applicable only to HIV or HCV sequences is labeled “HIV/HCV”.

In *HIV Molecular Immunology* 2005. Bette T. M. Korber, Christian Brander, Barton F. Haynes, Richard Koup, John P. Moore, Bruce D. Walker, and David I. Watkins, editors. Publisher: Los Alamos National Laboratory, Theoretical Biology and Biophysics, Los Alamos, New Mexico. LA-UR 06-0036. p. 33–56.

Formats

Convert between formats

Format Converter Converts sequence files between 18 standard bioinformatics formats. Automatic recognition of input format. (General)

Seq-Convert Converts between 8 standard bioinformatics formats. No automatic recognition of input format. (General)

Formatting for publication

SeqPublish Formats an alignment for publication: identical columns are replaced by dashes, and the sequences are printed interleaved in blocks of user-determined length. (General)

Sequence and alignment manipulation

Translate Converts nucleotide sequences to 1-letter amino acid sequences. (General)

Gapstreeze (Gap strip/streeze) Removes columns containing more than a user-determined percentage of gaps. (General)

Consensus Builds consensus sequences of alignments according to user specifications. (General)

Generation of alignments

Gene Cutter Extracts coding regions from a nucleotide alignment, codon-aligns and translates them, highlighting frameshifts, stop codons, and translates alternatives from IUPAC ambiguity codes. (HIV/HCV)

SynchAligns Synchronizes two alignments that overlap so they are aligned to one another, optionally trimming alignments to the region of overlap. (General)

PrimAlign Retrieves an alignment of a nucleotide sequence fragment (e.g., a primer) from our HIV complete genome alignment to assess variability. (HIV/HCV)

Epilign Retrieves an alignment of a HIV-1 peptide, epitope or functional domain from our web protein alignments to assess variability. (HIV/HCV)

Sequence analysis

Sequence characterization

Sequence locator Determines the beginning and ending positions numbers of sequence fragments in the genome or proteome relative to database reference strains. (HIV/HCV)

HIV/HCV BLAST Finds sequences most similar to your query in the HIV database. Helpful in detecting possible contamination issues. (HIV/HCV)

Sequence subtyping and recombination

SUDI Determines if a newly discovered set of related sequences should be considered a new subtype, according to standards developed by the HIV nomenclature committee. (HIV specific)

RIP Identifies intersubtype recombination by calculating similarity in a sliding window between your query sequence and a set of HIV-1 reference sequences of different subtypes. (General)

CRF-DRAW Maps HIV-1 recombinant breakpoints onto a graphical figure of the HXB2 genome, with parental subtypes indicated by different colors. (HIV/HCV)

Sequence analysis

VESPA Identifies site-specific signature residues that are rare in one group of sequences and common in another and calculates the frequencies of different amino acids in each position. (General)

PCOORD Summarizes the variation in the sequences in 10 dimensions using principal coordinate analysis. (General)

Hypermut Tracks base substitution patterns, and highlights G→A substitution events relative to other mutations, as they dominate in sequences damaged by hypermutation. (General)

N-Glycosite Highlights and tallies potential N-linked glycosylation sites in a protein alignment. (General)

Entropy Quantifies variation in a given position in an alignment using Shannon Entropy, and statistically compare variation in each position in two sets of aligned sequences. (General)

SNAP Calculates synonymous/non-synonymous substitution rates for a set of codon-aligned nucleotide sequences, based on the method of Nei and Gojobori. (General)

ADRA Finds mutations associated with anti-HIV drug resistance in HIV-1 protease, RT, integrase, and envelope sequences. (HIV)

Phylogeny

Phylogenetic trees

TreeMaker Generates a neighbor joining tree which is displayed and downloadable. PHYLIP outfile and Newick-formatted treefiles can also be downloaded. (General)

Search HIV sequence DB and make a tree Combines your sequences with those obtained through a database search, aligns the combined set, and generates a tree. (HIV/HCV)

FindModel Analyzes your alignment to see which evolutionary model best describes the input sequences. Can be used to generate a better phylogenetic tree. (General)

Immunology

PeptGen Generates a set of overlapping peptides according to user specifications from a protein sequence or an alignment. (General)

ELF Identifies potential and known epitopes in immunologically reactive peptides using HLA anchor motifs. (HIV/HCV)

Motif Scan Finds HLA anchor residue motifs within protein sequences for specified HLA serotypes, genotypes or supertypes using two major motif libraries. (General)

Hepitopes Tests for HLA alleles that are enriched in individuals that react with a set of peptides. Useful for population studies. (General, although the output can be combined with ELF and tailored to HIV/HCV.)

Also see, Epilign and Sequence Locator, above, two tools originally developed for mapping epitopes and their diversity.

Database searches

We are listing the HIV/HCV search capabilities here, although they will not be described in detail in this review; a comprehensive review of the databases and search interfaces will be included in the 2006 compendium.

HIV Sequence Database

Website content Google search for content and topics anywhere on our website. Where: small search box at upper left on most pages.

Sequence databases Search for sequences by selecting from numerous criteria such as subtype, genomic region, sequence length, geographic origin, time from infection, etc. From the results page, sequences can be selected, downloaded, used to generate a phylogenetic tree, aligned, translated, etc.

Advanced Search Build your own search criteria by selecting from a more extensive list of search fields than is available on the standard search page.

Detailed Descriptions of Tools

Search/display by geography Maps geographic distribution of HIV-1 sequences and their subtypes and can be used for sequence retrieval.

Drug Resistance DB Search for mutations that confer resistance to HIV-1 drugs. Search fields include protein, drug class and compound, amino acid position, citation, etc.

HIV Molecular Immunology Database

Website content Google search for content and topics anywhere on our web site. Where: small search box at upper left on most pages.

CTL epitopes Search for known CTL or CD8+ epitopes by protein, sequence, immunogen, vaccines, HLA, author or keywords. Retrieves epitope summaries from the literature, alignments, Medline links and epitope maps.

T-helper epitopes Search for T-helper or CD4+ epitopes, analogous to the CTL database.

Antibodies Search for HIV antibodies by protein, sequence, immunogen, AB type, author, monoclonal antibody name or keywords.

Best-defined epitopes Search for the best-defined CD8+ T-cell epitopes by serotype, genotype or protein.

Vaccine trials Search data from published studies on SIV, HIV and SHIV vaccine trials in nonhuman primates. Search criteria include objective, species, publications, vaccine immunogen, adjuvant and challenge.

I-C-3 Detailed Descriptions of Tools

Seq-Convert—Format conversion

Purpose This interface combines four different sequence alignment format conversion tools.

Background Many tools on the website now are fairly good at automatically recognizing common sequence formats, but in some cases they fail and manual conversion is necessary, or a user may need to change their sequence format to make it compatible with another tool. Seq-Convert is a combination of

1. Seq-Convert, which in turn combines code from an extension of the READSEQ program developed by Don Gilbert [Gilbert] and code developed by the HIV database staff to produce the table, GDE and SLX output formats. The interface can read all formats it writes except for these three.
2. Omniread: This tool attempts to automatically recognize the format of your input file, using a different combination of the programs Fmtseq and Readseq.
3. cf: This tool, developed by Charles Calef at the HIV database, attempts to automatically recognize and convert a total of 18 sequence formats.

4. Readseq2: A web interface to the update of Readseq, Don Gilbert's sequence reformatting tool.

Sequence reformatting is a recurring and difficult problem. Many formats are only very loosely defined, while others are very strictly defined but difficult to parse. Our databases mostly use fasta and table format, but some 50 different formats are used in the sequencing world. The Seq-Convert suite combines enough programs that almost any sequences can be converted to something more common, but it may require some experimentation to find the right tool for unusual formats. The tool shows the resulting sequences, so the user can decide quickly if the conversion has succeeded or not.

History and context Seq-Convert is a combination of efforts of several people. Don Gilbert created the Readseq and Readseq2 programs. Brian Gaschen wrote the code for Seq-Convert, the least flexible but probably the most robust tool; Charles Calef wrote cf, which is very flexible but not extensively tested. Carla Kuiken created Omniread by testing the Readseq and Fmtseq input and output algorithms and combining the best of those. Anita Dalwani combined all tools in one website.

SeqPublish

Purpose Make visually attractive, publication-quality alignments.

Background This interface takes a sequence alignment and replaces residues identical to those in a reference sequence with dashes. Either the first sequence in the input alignment will be used as the reference sequence for the output, or you can create a consensus from the alignment to be used as the reference sequence. This program is useful for making publication quality figures, or for exploratory work that involves visually assessing levels of variation in a region. It can be used in conjunction with alignments created using the search interface.

History and context Implemented by Patrick Rose and Kristina Kommander; designed by Carla Kuiken.

Translate

Purpose This simple program translates nucleotide sequences to amino acids in frame 1 or all frames. Users who retrieve nucleotide alignments from our database but who are unfamiliar with multiple alignment programs can easily obtain an amino acid alignment.

History and context Suggested by a database user. Implemented on the web by Charles Calef using a translation subroutine by Brian Gaschen.

Gapstreeze—Gap Stripping and Squeezing

Purpose Remove columns of gaps from an alignment. Generally useful for preparation of alignments for phylogenetic analysis. Offers various options like removing only positions that contain more than a user-specified percentage of gaps.

Background HIVs and SIVs not only evolve by base substitution, but they also frequently mutate through insertions and deletions (indels), which tend to be imperfect direct repeats focused in hypervariable “hot spots”. These regions can be difficult to align, and gaps must be included to compensate for insertions and deletions relative to other sequences in the alignment. While indels are often forced into the same positions in an alignment, it can be difficult to resolve whether they have evolved by base substitution, the baseline assumption of most phylogenetic tree programs, or by insertion and deletion. For example, a single insertion event of 15 bases might suggest unreasonably large evolutionary distances between two otherwise very closely related sequences. A blunt way to resolve this problem is to simply remove all positions from an alignment that have a gap inserted to maintain the alignment. Alignment programs generally use a tilde (~), or dash (-), to indicate a gap. Positions with missing information in some sequences will also be deleted, so the gene regions compared between all sequences will be the same. For this reason, users may want to remove particularly short sequences from an alignment before gap-stripping, as the alignment will only be as long as the shortest sequence included.

How to use Set the value of tolerance between 0% and 100%. A value of 0% will cause columns to be deleted if they contain any gaps (gapstrip), while a value of 100% will delete only columns that are entirely (100%) gaps (gapsqueeze). An intermediate tolerance value, of say, 10% will delete columns with more than 10% gap characters. You can define multiple gap characters and even specify ordinary letters to be gaps. This latter tactic is useful if, for example, you are interested in removing all columns containing IUPAC ambiguity codes (e.g. R and Y) from your nucleotide alignment, thereby preserving only columns with ATGCU. The “Show deleted columns” feature will include the intact first sequence in the output with marks showing columns that were deleted in the stripped alignment that follows. The default values set for the submission page will cause only columns that are 100% dash (-) characters to be removed.

History and context Many programs enable gap stripping, but Gapstreeze offers more flexibility with regard to specifying which columns are deleted, and retains a record of deleted columns. The record is particularly helpful if it

is important that the alignment is codon aligned, as HIV sequences are often not biologically active and contain frameshift mutations. Any contiguous deleted columns that are not divisible by three would cause a frameshift downstream for the entire alignment. Brian Gaschen wrote the original script to facilitate preparing sequences for phylogenetic analysis, implementing features requested by Bette Korber; Charles Calef created an improved version and made a web interface.

Consensus Maker

Purpose Consensus Maker takes an input file of aligned sequences and calculates a consensus sequence for those sequences. Consensus sequences are useful as reference sequences for alignments or for reagent design.

How to use The consensus tools website offers three choices for creating a consensus of your alignment: simple, advanced, and ambiguity:

Simple consensus This option calculates a quick consensus of an alignment based on customary parameter choices.

Advanced consensus This option allows complete control over consensus parameters such as the values to be used for unanimity and majority, what characters to consider when making the consensus, whether to squeeze gaps, etc.

Ambiguity consensus A consensus sequence made up of the IUPAC ambiguity codes for each column in a nucleotide alignment can also be computed.

Example ambiguity consensus:

CON	AGCTRWMYSK	HDBVNA
A.sequence1	AGCTAAACGG	aagaAA
A.sequence2	AGCTAAACGG	cgcgGA
A.sequence3	AGCTAAACGG	tttcCA
A.sequence4	AGCTAAACGG	tttcTA
B.sequence5	AGCtAAACGG	tttcAA
B.sequence6	AGCtAAACGG	tttcGA
B.sequence7	AGCtAAACGG	tttcCA
B.sequence8	aGctGTCTCT	tttcTA
B.sequence9	aGctGTCTCT	tttcGA
B.sequence10	aGctGTCTCT	tttcTA
B.sequence11	#\$*!?xxyyz	zttcCA

Input options

Format of input alignment Consensus Maker recognizes most standard alignment formats.

Squeeze gaps If your alignment contains columns that are entirely gaps, they will be removed before a consensus is calculated. Default is squeeze gaps. You can also specify what character is used in your alignment to signify gaps. The default is -.

Detailed Descriptions of Tools

Output options

Do consensus for each block If the input contains blocks of sequences, such as subtypes, then calculate a consensus for each block, not just a single consensus for the alignment as a whole. Default is false.

Minimum number of sequences for a consensus If a block contains fewer than n sequences, then don't calculate a consensus for that block. Default is 3.

Do consensus of consensus If consensus are to be computed for each block in the alignment also calculate a consensus of these consensus. (This would provide an HIV-1 M group consensus weighting all subtypes equally). Default is false.

Consensus + alignment Results will show consensus appended to the top of the user's alignment. Default is true. When false, the output consists of the consensus alone.

Output format A "pretty print" output shows your alignment aligned to the consensus with 50 characters per line and spaces every 10 characters.

Consensus calculation options

Unanimous value The fraction of characters in a column of the alignment needed to establish unanimity (shown as a capital letter) for that column. Default is 1.0.

Majority value The fraction of characters in a column of the alignment needed to establish majority (shown as a lowercase letter) for that column. Default is 0.5.

Use most common character This option determines what symbol to enter in the consensus for a column that has no majority character. Suppose a column contained letters AAAGTTC. Does the user want that column to be represented in the consensus by a (i.e., the most common letter) or by ? (i.e., no letter forms a majority)? If so, then set this value to false. If multiple blocks are present in the alignment and there is a tie between two letters in one block, the program will try to resolve the tie by looking at that column of the alignment in all other blocks as well.

Characters to count when making consensus This is a set of characters ("letters") that the program considers when making a consensus. The default for nucleotide alignments is the set of valid nucleotide characters and the gap character ACGTU-. Using these defaults, the alignment column AAAAXAA would have a consensus of A because the X character is ignored—it's not in the set of valid characters.

Use any character when making consensus Finally, if you want to consider *all* characters (including blanks, *, x, \$, etc.) when making a consensus, check this box.

Options unique to ambiguity consensus

Characters to count when making consensus The program considers ACGTU when making a consensus.

Character presence percentage If a column of an alignment contained 99 A and 1 G would you want to give this a consensus of A or R, where R is the IUPAC code for purine (A or G)? In other words, if a character is present below a certain "presence percentage" threshold, should it be ignored when making the consensus? You can set this presence percentage threshold in the box provided. The default is 0, which means every occurrence of an A, C, G, T or U counts. If you had set the value to, say 2%, then the G in the above example would be ignored and the consensus would be A.

History and context We make alignments relative to consensus sequences to minimize the changes in the alignments and make it easier to see the differences between sequences. Consensus sequences also are central to circulating strains, and can be synthesized for vaccine design [Korber *et al.*, 2001; Gaschen *et al.*, 2002] or in reagent design (for example, HIV consensus sequence overlapping peptide sets for EliSpot [Korber *et al.*, 2001]). The tie-breaking algorithm and the concept of creating an HIV-1 M group consensus as the consensus of the subtype consensus sequences was developed by Bette Korber for reagent design. Charles Calef, with input from Carla Kuiken, developed this web-based tool to generate consensus sequences. Ready-made consensus are available in our alignments section, useful in reagent design, and periodically updated.

Gene Cutter

Purpose Gene Cutter extracts pre-defined HIV-1 protein coding regions from a set of nucleotide sequences, then codon aligns and provides translations of the cut regions. It is particularly helpful for processing alignments of full-length HIV-1/SIVCPZ or HIV-2/SIVSMM genome sequences, or long interior regions that contain multiple coding regions.

Background All coding regions are clipped from a nucleotide alignment, and a matched codon-aligned nucleotide and translated protein alignment are created. Gene Cutter translates all codon possibilities in sequences containing IUPAC/IUB multistate characters, and provides a web-based format that allows users to move rapidly between nucleotide and protein alignments, and get details regarding translational properties of multistate characters. This tool is useful for sequence quality control of new sequences, as all stop codons and frameshifts are highlighted so potentially lethal mutations can be rapidly identified and cross-checked. Indels cause problems for multiple alignment programs, and often codons are split in an automated alignment and not readily translated; Gene Cutter will keep codons associated in the sequence. If a lethal frame shift occurs that is not compensated for within five

amino acids downstream, the codon is translated as a hash, (#), and the appropriate downstream translation of the sequence beyond the inactivating substitution is thus enabled. The protein translations Gene Cutter creates can also be helpful for generating GenBank submissions.

Input The input file can include either HIV-1 and SIVCPZ sequences or HIV-2, SIVsm and SIVmac, but these sets should not be mixed because of different gene boundaries. Gene Cutter is organism-specific and does not extend to all primate lentiviruses, just the two human HIV lineages and their most closely related SIVs. Sequences can either be aligned, in which case Gene Cutter will modify the alignment to make it codon aligned and split out each codon region, or unaligned, in which case Gene Cutter will create a baseline alignment. The unaligned input option takes longer to run.

Output The matched nucleotide and amino acid alignments can be saved to your computer for further study. Working with the output on the web interface enables rapid switching between DNA and protein alignments and identification of problematic frame shifts and stop codons. A nucleotide alignment could be opened in BioEdit, and the ability to move between nucleotide and protein alignments would be retained. We recommend reviewing your Gene Cutter alignment (or any automatically generated alignment) and hand editing as needed.

History and context Brian Gaschen first developed this tool for internal database work, in response to increasing acquisitions of large numbers of full-length sequences that needed rapid processing. He built the public web interface incorporating suggestions provided by local users Bette Korber, Thomas Leitner, as well as outside users Jean Carr at the Henry M. Jackson Foundation, Rockville, MD, and James Mullins and colleagues at the University of Washington, Seattle, WA.

SynchAligns—synchronize alignments

Purpose Align two different alignments of the same gene region or protein to each other. The two alignments need not cover the identical genomic span but they must overlap. One application of this tool is combining a reference or database alignment with a novel set of study sequences.

Background A SynchAligns option was initially added to the BioEdit sequence editor [BioEdit] at the suggestion of the HIV database. The HIV/HCV database version uses align0 [Myers & Miller, 1988] to align one sequence from each alignment; the gaps that were inserted into each

sequence are then applied to the rest of the alignment, and the two alignments are concatenated.

Input options The user may specify a reference sequence common to both alignments to be used in synchronizing. Failing that, the program will select the longest sequences from each alignment to use as references. Gap characters and whether to squeeze them can be specified. The synchronized alignment can be trimmed to the region of overlap between the two component alignments.

Output A single synchronized alignment in the same format as the second input file or “pretty-printed” versions of this alignment.

Example:

```
align1  GSEEL-RSLY-NTVATL
        GSEELMRSLYMNTVATL
        GSEELMRSLY-NTVATL

align2  EELRS-LYNTVATLYCVHQ
        EELRSPLYNTVATLYCVHQ
        EELRSPLYNTVATLYCVHQ
        EELRSPLYNTVATLY-VHQ
```

Result after SynchAligns:

```
GSEEL-RS-LY-NTVATL- - - - -
GSEELMRS-LYMNTVATL- - - - -
GSEELMRS-LY-NTVATL- - - - -
- - EEL-RS-LY-NTVATLYCVHQ
- - EEL-RSPLY-NTVATLYCVHQ
- - EEL-RSPLY-NTVATLYCVHQ
- - EEL-RSPLY-NTVATLY-VHQ
```

History and context This tool was developed at our sister database, the Los Alamos HCV database, by Carla Kuiken and Charles Calef, and is included in the HIV database tools as well.

PrimAlign—explore DNA primer diversity

Purpose PrimAlign generates an alignment of your nucleotide sequence against our complete genome alignment.

Background PrimAlign can be used to rapidly assess variation in primers, functional domains, or any HIV nucleotide sequence of interest. The HIV complete genome alignments are meant to approximate a population survey. They are updated annually and include only a single sequence per person, but still have sampling biases.

If obtaining an alignment of all sequences in the database is desired, or just a subset (for example, all Ugandan D subtype sequences in the database that span the fragment) the Sequence Locator tool can be used to find the

Detailed Descriptions of Tools

Figure I-C.1: PrimAlign sample output

```

QUERY          ATGGGTGCGA GAGCGTCAAT ATTAA
A1.BY.97.97BL006  -YR-----G-----
A1.KE.00.KER2008  .....-----G-----

```

boundary positions of the fragment in the HXB2 genome, and these can be used to extract all sequences covering that region directly from the search interface of the HIV database [Gaschen *et al.*, 2001]. But beware, such database searches often can return hundreds of sequences from one subject if, for example, the individual was enrolled in a longitudinal study.

Input The direct sequence or its reverse complement (for primers) can be used as input.

Output A map that shows the position of the query relative to the HXB2 reference strain and an alignment of the fragment to all sequences from the same region in our curated alignment of complete genomes. Sequences whose names are printed in red are identical to the query. A simple fasta version of the alignment is available for downloading. Sequences include the subtype (A1 in the example below), followed by the country where the sample was taken (BY), the year of the sample (97), and finally the sequence name (7BL006).

History and context This tool was developed in parallel with its protein analog Epilign by Satish Pillai and Bette Korber, with support from Charles Calef. The alignment strategy and output options were later improved by Charles Calef and Brian Gaschen.

Epilign—explore epitope diversity

Purpose Epilign generates an alignment of your protein sequence against our web-based protein alignments.

Background Epilign can be used to get a rapid overview of the variability of an epitope, peptide, or protein. The location of the input sequence is automatically determined, and it is aligned to the HIV-1 database protein alignments, which excludes very similar sequences (e.g., multiple clones from one isolate, multiple sequences from one person), and so is meant to be a population survey.

Output A map (not reproduced here—see Figure I-C.5 in Sequence locator, below) is generated that shows the position of the query relative to the HXB2 reference strain. An alignment of the fragment to all sequences from the same region in our curated protein alignments is also created. Sequences whose names are printed in red, are identical to the query. If there are gaps in the main protein

alignment, there is an option to squeeze the gaps and shift the sequence towards the C-terminal end. This is how potential T-cell epitopes would be seen by the immune system. The alignment is available for downloading in three simple formats. On the output page are two buttons that summarize the frequency of variants of your query. This analysis can be done for the entire alignment or for each subtype groups in the alignment.

Figure I-C.2: Epilign sample output, alignment results

```

Query          SLYNTVATL
A1.KE.86.ML170  --F-----
A1.KE.94.Q23    --F-----
A1.SE.94.SE7253 --F---V-
A1.SE.94.SE7535 -----
A1.SE.95.SE8538 -----

```

Figure I-C.2 shows the top of the alignment for the SLYNTVATL epitope. The sequence names indicate the subtype (A1), the two letter country code (KE for Kenya), year of sampling (86 for 1986) and the sequence name.

Figure I-C.3: Epilign sample output, summary by subtype

Variant	Count	Percent
SLYNTVATL		
-----	7	53.8
--F-----	3	23.1
--F---V-	2	15.4
-----V-	1	7.7

Total sequences = 13
Number of variants = 4

Figure I-C.4: Epilign sample output, subtype histogram

Figure I-C.3 summarizes the variation of the A1 subtype for this epitope. Of 13 A1 subtype sequences, 53.8%

are identical, and 23.1% differ from the query by having only an F substitution at position 3. These data are also presented in histogram form (Figure I-C.4). Further summaries of each kind of variant in every subtype are also provided but not shown here.

History and context This tool was developed in parallel with its nucleotide analog, Epilign, by Satish Pillai and Bette Korber, with support from Charles Calef. The alignment strategy and output was improved by Charles Calef and Brian Gaschen. Richard Koup (NIH) suggested adding the graphical representation of the identities in each subtype.

Sequence locator—HIV/SIV sequence locator tool

Purpose Finds the genomic position of a nucleotide or protein sequence in HIV-1/SIVcpz or HIV-2/SIVsmm/SIVmac relative to the reference strains HXB2 and SMM239.

Background Because HIV sequences vary in length, inconsistent and inaccurate numbering of locations in HIV DNA and protein sequences remains a problem in the literature. Positions published without reference to a strain (for example Gag positions 242–251), are meaningless because insertions and deletions change the length of HIV proteins. Often the numbers are not precise and do not match the reported sequence. This tool enables publication of precise and accurate positions relative to our reference strain HXB2 (GenBank accession number K03455). See the HIV database reviews about HIV and SIV numbering for more details [Korber *et al.*, 1999; Calef *et al.*, 2002a].

Output The query HIV epitope SLYNTVAAL produces the output shown in Figure I-C.5.

The “NA position relative to the HXB2 genome start” can be used as input on our sequence search interface to retrieve sequences of interest that span a given region. A user can also input HXB2 positions (e.g., p17 77–85) and retrieve the corresponding amino acids.

History and context This tool was initially designed and implemented by Bette Korber and Satish Pillai, with input from Joseph Sodroski at Harvard. Improved versions of this code were designed and developed by Charles Calef with input and the addition of the SIV locator from Brian Foley, John Mokili, Bette Korber, and Carla Kuiken.

HIV BLAST

Purpose Performs a BLAST search [Altschul *et al.*, 1997] restricted to the HIV Sequence Database.

Background The interface can handle both nucleotide and amino acid sequences, and calls these searches either BLAST or TBLASTN, respectively. In addition, you can access a smaller BLAST database that excludes sequences whose subtype is unknown; this restricted database can help identify the likely subtype of the query. HIV-1 specific BLAST results can be particularly useful for identifying potential contamination events. If the query perfectly matches a common lab strain, contamination may be indicated. While traditional BLAST searches explore vast databases looking for statistical support of genetic relationships, virtually all HIV and SIV sequences are statistically highly related. BLAST searches are useful simply to identify the closest sequences in the current database.

Output Aside from the standard BLAST scores and query/match alignments, you can also download all or a selection of the sequences your BLAST search finds. If you choose the ‘master-slave’ output option, the downloaded sequences will be aligned. If you choose ‘pairwise’, the downloaded sequences will not necessarily be aligned. Output includes the sequence name, sampling country, and subtype, which are not provided by an NCBI search.

History and context This derivative application of the search tool developed at NCBI was suggested by Carla Kuiken and Bette Korber, and implemented by Charles Calef.

SUDI—Determining if a new subtype or sub-subtype has been identified

Purpose Helps determine if a newly defined clade of related sequences should most appropriately be considered a new subtype, a new sub-subtype, or part of a previously defined subtype.

Background SUDI was created at the request of participants in the 2000 HIV nomenclature committee [Robertson *et al.*, 2000a,b]. SUDI’s purpose is to determine tree-based genetic distances for a new cluster relative to known subtypes, and then to compare these distances to typical distances found among pre-existing subtypes. Because absolute levels of similarity will depend on the region under consideration, the time of sampling in an ever-diverging epidemic, and the specific alignment, no absolute criteria for intra- and inter-subtype distances are included.

Input SUDI can use either an alignment or the outfile of a PHYLIP tree building program. The default tree for the program is a PHYLIP neighbor-joining tree built using an F84 model. If users want to base the analysis on a different tree, then a user tree can be created with PHYLIP, and the PHYLIP outfile can be used as the input for SUDI.

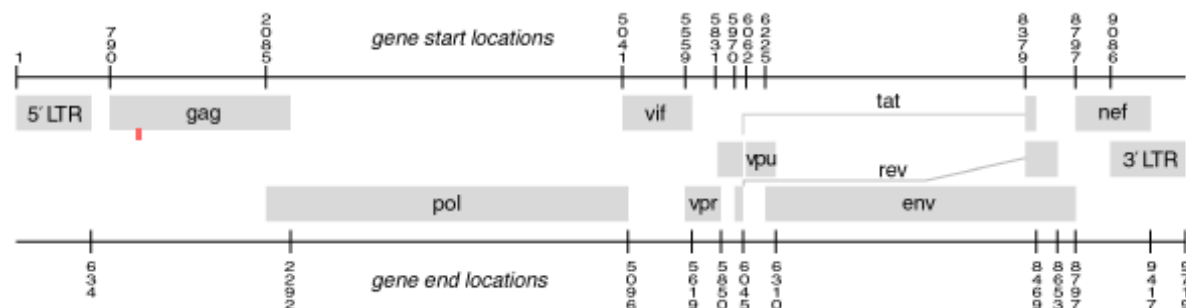

Figure I-C.5: Sequence locator sample outputOrganism: **HIV**

Table of protein regions touched by query sequence. AA = amino acid, NA = nucleic acid.				
CDS	AA position relative to protein start in HXB2	AA position relative to query sequence start	NA position relative to CDS start in HXB2	NA position relative to HXB2 genome start
Gag	77->85	1->9	229->255	1018->1044
p17	77->85	1->9	229->255	1018->1044

Alignment of the query sequence to HXB2:

Query SLYNTVAAL 9
 : : : : : : :

 HXB2 PRO _S_L_Y_N_T_V_A_T_L

Output Based on the tree, histograms will be generated showing the range of intra-subtype distances, inter-subtype distances, and sub-subtype distances. The category that a given pairwise distance is assigned to (intra-subtype, inter-subtype, or sub-subtype distances) will depend on how the sequence was labeled (A_, B_, ...) and how the clusters were defined. The cluster of sequences that the user is interested in, those sequences labeled 'U', will be highlighted. The U intra-subtype distances will be shown, and the U inter-subtype distance relative to the subtype closest to U will be shown. This way the user can determine if the novel cluster should be broken into sub-subtypes, or be considered part of a previously defined subtype.

History and context SUDI was written by Bette Korber and Bob Funkhouser. Patrick Rose assisted with the interactive web interface.

RIP

Purpose The Recombinant Identification Program (RIP) is a computer program developed at the HIV Database to identify genetic sequences that appear to be mosaics of members of distinct phylogenetic clades. The idea is that such mosaic sequences are likely recombinants [Siepel *et al.*, 1995].

Background RIP was designed to detect recombinants of sequences belonging to different subtypes of HIV-1, but it can be used for other applications, including analysis of non-HIV sequences. The program moves a "window" of specified length stepwise across an alignment containing a query sequence and several background representatives. For each step in the window's progression across the genome, the query is compared to each of the background representatives within the window, and similarity is quantified as the fraction of identical base pairs. The values are

Figure I-C.6: SUDI sample output

retained, and the window is advanced one position. After the window has traversed the alignment from left to right, the program displays output revealing which background representative the query sequence most resembles at all possible positions. So-called “best matches” are marked if they are significant according to a statistical test.

Input There are three options for creating the alignment that RIP analyzes. 1. You may submit a single sequence, the query, and have RIP align it automatically to the subtype consensus alignment. 2. You may submit a single sequence, the query, and then build a custom background of sequences by selecting from a list provided on the website. 3. You may submit an alignment of your own that you have built with your query as the first sequence in the alignment. This option runs faster than the other two because RIP skips the alignment step. The size of the sliding window and the statistical significance threshold can be adjusted by the user. Gaps in the alignment can be handled in four different ways.

Output The default output consists of graphs showing the distances between the query sequence and the background set for each window position, and an alignment annotated with the best match sequence and whether or not it is statistically significant.

History and context A sliding window approach to identifying recombination events was first developed by Bette Korber and Adam Siepel [Siepel *et al.*, 1995]. In the fall of 1995 we used RIP to scan the HIV Database’s env and gag master alignments for intersubtype recombinants [Siepel *et al.*, 1995]. Since its original development, RIP’s web interface has been much improved by Thomas Leitner, Carla Kuiken, Brian Gaschen, Bette Korber, and Charles Calef.

Draw CRF—Make a figure to graphically represent recombinant genomes

Purpose Draws maps of HIV-1 genomes that are known to be recombinant. The different subtypes that comprise your genome appear as colored regions in the map.

Input The data used by the program record the points at which each component subtype in the genome begins and ends. If exact breakpoints are not known, there is a mechanism for entering uncertain boundaries. The breakpoint coordinates should be in standard HXB2 coordinates. The program can convert your data to HXB2 coordinates automatically if you select that option. A sample of input data looks like this:

```
1 2677 G
2678 3345 A
```

Detailed Descriptions of Tools

that are extracted correspond to an epidemiological variable or some other feature of the data. The patterns that are found using PCOORD usually can be seen in a phylogenetic tree as well, but they may be much less pronounced there.

Output Each sequence gets a score on each of the dimensions, and these scores can be plotted pairwise. The coordinates can be downloaded, so that a better-looking graph can be produced with a spreadsheet or graphing program. The PCOORD program can identify each sequence with a character (number, letter, or symbol such as * or ^). To use that feature, you need a file with one character for each sequence. In the dimension plot, the point representing each sequence will then be identified by the corresponding character.

History and context The PCOORD program suite was developed by Des Higgins [1992] (then at the EMBL), and adapted for the UNIX platform by Jack Leunissen of the CAOS/CAMM institute in Nijmegen, The Netherlands. The web interface was created by Kersti Rock based on specifications by Carla Kuiken [Kuiken *et al.*, 1993; Potts *et al.*, 1993; Kuiken *et al.*, 1994].

Hypermur

Purpose Hypermur highlights hypermutational changes among other base mutations [Rose & Korber, 2000]. It takes a nucleotide alignment and documents the nature and context of nucleotide substitutions in a sequence population relative to a reference sequence.

Background A retroviral provirus is considered hypermutated if it undergoes an inordinate number of identical transitions, usually guanine to adenine (G→A). Hypermutation most often results in the production of replication-incompetent virus. Several papers were published in 2003 describing a host cellular defense mechanism that induces hypermutation in reverse transcribed nascent retroviral DNA. The Vif protein of HIV seems to be able to counter this activity [Mangeat *et al.*, 2003; Zhang *et al.*, 2003; Lecossier *et al.*, 2003].

Identifying hypermutated sequences in a viral population can be critical when reconstructing viral phylogenies (to assess the effects of drug therapy, immune surveillance, etc.). The apparent rate of viral evolution can be dramatically exaggerated by hypermutated sequences, when in actuality these viruses are evolutionary dead ends; their profound divergence is an artifact of a single aberrant round of replication.

Input The first sequence in the input alignment will be used as the reference sequence for the entire analysis, so

this sequence should be chosen carefully. For example, for an intrapatient set, the reference should probably represent the most common form in the first sampled time point. For a set of unrelated sequences, the consensus sequence for the appropriate subtype would be used. Also, you may choose to display a general or region-specific overview of your sequences.

Output Hypermur output consists of

- a data sheet summarizing the hypermutations,
- a graphical overview of all the sequences and their nucleotide changes,
- a graphical overview of all mutations in a selected sequence, and
- a table for allowing quick analysis of mutations resulting in stop codons.

The program allows either an overview of the complete sequence, or a detailed view of a subregion. The hypermutational changes are color coded.

History and context HYPERMUT was originally written by Bette Korber and web development was undertaken by Patrick Rose; improvements were made by Werner Alfalterer. Francine McCutchan, Jean Carr, and Feng Gao offered suggestions for additional analysis. An application of the method to the HIV database is described by Rose & Korber [2000].

N-Glycosite

Purpose This tool highlights and tallies potential N-linked glycosylation sites in an aligned set of protein sequences.

Background The N-linked glycosylation site pattern N-x[ST] (where N is asparagine, x can be any amino acid, and [ST] is serine or threonine) is called a sequon. N-Glycosite can be used for any protein alignment, but is particularly helpful for the HIV envelope as it is heavily glycosylated. Sequons vary in position and number, and glycosylation can be critical for protein function and for immune evasion [Zhang *et al.*, 2004]. The extent of actual glycosylation of a sequon depends on the context, which could be expanded to a four amino acid N-x[ST]y pattern where the amino acids in the x or y positions influence the glycosylation efficiency. In particular, proline in position x or y does not favor N-linked glycosylation. Thus we also provide N-x[ST] or N-x[ST]y summaries.

Input If you just want to tally the number of N-glycosylation sites, this can be done with unaligned sequences, but to track movement or changes in particular sequons, aligned sequences are necessary.

Output The initial output page contains links to all other output files. These include an alignment with the N-linked sites highlighted (Figure I-C.10), tallies of the number of sequons in every sequence in an alignment, figures showing the fraction of each position in an alignment that contains an asparagine (N) that is part of a sequon (Figure I-C.10), and tallies of the number of sequons in a window of user specified length moving through the protein alignment.

History and context Bette Korber developed a simple version of this code for analysis of acute infection sequences [Derdeyn *et al.*, 2004]. Ming Zhang then made a web interface and added many useful features suggested by Brian Gaschen and Bette Korber.

Entropy

Purpose Assigns a quantitative measure of diversity to every position in an alignment, and compares one alignment to another to see if there is statistically supported evidence for positions with increased diversity in one set relative to another.

Background This code provides one strategy for quantifying sequence diversity, using the information theory concept of Shannon entropy [Shannon, 1948]. This code was originally used to compare blood derived HIV envelope sequences from two data sets, and we found evidence for sites that were more variable in the blood than brain [Korber *et al.*, 1994]. A second application compared the variability of sequence positions to immunologically important regions. Here the Shannon entropy of each position was calculated, and compared to some other biological property that has been characterized for that position. For example, the number of distinct cytotoxic T-lymphocyte (CTL) epitopes that span a position inversely correlates with the variability of that position [Yusim *et al.*, 2002]. In this application, the entropy scores were compared with another score of biological interest, in our case CTL epitope density.

Output Entropy comes in two flavors, called Entropy-one and Entropy-two. To calculate the entropy for positions in a single alignment, use the Entropy-one interface. If you want to compare the entropy in two different sequence sets (they will need to be aligned to each other), use the Entropy-two interface.

Entropy-one also estimates the average entropy of all positions in a given window size, advancing the window by a user-specified length.

Entropy-two compares the entropy in to different sequence sets. To assess statistical significance, a user-specified number of Monte Carlo randomizations of two

sequence sets can be performed, and a comparison of the difference in entropy between the real data and the randomized data sets can be used to determine whether a difference in entropy was likely to have been observed by chance alone or is significant.

History and context This code was originally written by Bette Korber [1994] with the Monte Carlo randomization implemented by James Theiler. Ming Zhang adapted it to the web and added features suggested by Brian Gaschen, Carla Kuiken, and Bette Korber.

SNAP

Purpose Calculates synonymous versus non-synonymous base substitutions for all pairwise comparisons of sequences in a codon-aligned nucleotide alignment.

Background SNAP is based on the method of Nei & Gojobori [1986]. You should be familiar with this paper before using this program.

Output The number of synonymous and non-synonymous codon changes are counted, as well as the number of potential synonymous and non-synonymous changes when comparing two sequences. Ambiguous codons or codons with insertions are excluded from the tally of compared codons. The output provides overall sequence distances as well as a codon by codon summary. One must be wary when doing typical statistical analysis of these values. Distributions of values that are far from Gaussian are commonly found, so you should either check to see if you have a Gaussian distribution, or default to the use of non-parametric statistics, like a Wilcoxon rank sum test. Therefore the averages given at the bottom are only meant as a crude guide. Also, if one uses the full column of values for all pairwise comparisons (say all values of d_n for one set, compared to all values for another set) there is a non-independence of points issue to be considered. An alternative is the use of a sequence like a consensus or a best estimate of an ancestral sequence as the first sequence in the alignment, and then just use the comparison of the first sequence to all others rather than all pairwise comparisons.

History and context SNAP was written by Bette Korber [2001], and adapted for the web by Satish Pillai. It was one of the earliest attempts to analyze synonymous versus nonsynonymous mutation rates in a way that was not averaged over entire genes; more sophisticated tree-based methods were later developed, although this method is simple in concept and also tracks insertions and deletions, and so still merits consideration. An application of

the SNAP package is described in Ganeshan *et al.* [1997]. Statistical analysis was added at the suggestion of Yumi Yamaguchi-Kabata, following the method described in Ota & Nei [1994].

ADRA

Purpose Finds mutations associated with anti-HIV drug resistance in HIV-1 protease, RT, integrase, and envelope sequences. Accepts both nucleotide or amino acid sequence input.

Output Produces a table of resistance-associated mutations (Figure I-C.14) and an alignment with mutations indicated (Figure I-C.15). Tabulates drugs to which this sequence may show resistance and links to additional information on these mutations in the HIV Drug Resistance Database [Clark *et al.*, 2001].

History and context This tool was designed and written by Patrick Rose and Charles Calef as a way to explore the HIV Drug Resistance Database (http://resdb.lanl.gov/Resist_DB/default.htm maintained within our Los Alamos database by John Mellors.

TreeMaker

Purpose To produce “quick and dirty” trees. Our aim is not to make them dirty, but to make them quickly. These trees are generally not publication quality, but are meant to be used in an exploratory framework.

Background TreeMaker generates a neighbor-joining tree based on a sequence alignment. The tree is very basic and quite possibly not optimal for any dataset. The database tool FindModel, described below, can be used to determine the optimal model. We also provide a tutorial that gives some background information about phylogenetic tree construction, and provides further links.

Output The tree is displayed as a PNG file, and can also be downloaded as a PostScript or PDF file. Currently, the PHYLIP outfile and the Newick-formatted treefile can also be downloaded. By default, this interface uses the F84 distance model (also called “ML” because it is used in PHYLIP’s maximum likelihood phylogeny program DNAML). This model incorporates different rates of transition and transversion, and also allows for different frequencies of the four nucleotides. Several other distance models are available. TreeMaker will be updated to use

the PAUP* based trees, similar to our tree building part of the search interface.

History and context This tool was originally developed by Carla Kuiken and Charles Calef. A completely new version of tree making is now part of our search interface (to be described in the 2006 compendium). This version is based on PAUP* and was made by Thomas Leitner, Charles Calef and Werner Abfalterer. We are grateful to Jim Wilgenbush who has given us permission to use PAUP* [Swofford, 2002] to infer our trees.

FindModel

Purpose FindModel analyzes your alignment to see which evolutionary model best describes the input sequences. This model can then be used to generate a better phylogenetic tree.

Background FindModel uses the program Weighbor [Bruno *et al.*, 2000] to generate the guide tree, based on Jukes-Cantor distances. Weighbor is used because it is much faster than maximum likelihood, but less biased and more robust than neighbor joining. Ziheng Yang's PAML [Yang, 1997] is used to calculate the likelihood. The AIC score, a version of the likelihood score that is weighted to compensate for the differences in degrees of freedom (or the number of parameters included) for each model, is calculated using the method described in Posada & Crandall [1998]. The standard log likelihood score is also reported, but the decision of the best fitting model is made based on the AIC. It is intuitively clear that a model that is more 'customizable' to the data, i.e., has more parameters, will usually produce a better fit. This would always result in the most complicated model being selected, even when simpler models would do almost as well. The AIC score compensates for this effect by weighting the likelihood

Table I-C.1: Partial view of the list of models and their AIC and likelihood scores.

Model name	AIC	LnL
JC : Jukes-Cantor (model 1)	3563.252246	-1781.626123
JC+G : Jukes-Cantor plus Gamma (model 3)	3504.693372	-1751.346686
F81 : Felsenstein 1981 (model 5)	3564.440496	-1779.220248
F81+G : Felsenstein 1981 plus Gamma (model 7)	3502.851558	-1747.425779
K80 : Kimura 2-parameter (model 9)	3499.844658	-1748.922329
K80+G : Kimura 2-parameter plus Gamma (model 11)	3423.016278	-1709.508139
HKY : Hasegawa-Kishino-Yano (model 13)	3499.375768	-1745.687884
HKY+G : Hasegawa-Kishino-Yano plus Gamma (model 15)	3412.457576	-1701.228788
TrN : Tamura-Nei (model 21)	3494.642212	-1742.321106
TrN+G : Tamura-Nei plus Gamma (model 23)	3413.187698	-1700.593849
GTR : General Time Reversible (model 53)	3487.768892	-1735.884446
GTR+G : General Time Reversible plus Gamma (model 55)	3411.658894	-1696.829447

score by the number of parameters for each model. FindModel, unlike Modeltest, does not allow invariant sites, because this feature is not implemented in PAML. This was a principled choice by PAML's author, because estimates of the fraction of invariant sites tend to be very sensitive to the number of taxa.

Finding the best evolutionary model is a computationally intensive procedure, both in its original implementation as the Modeltest PAUP* script and in our FindModel implementation. To reduce the computational burden on our servers, we have limited the default runs to a reduced set of models, and excluded those that do not have an obvious biological interpretation. The full set of models can be run, but has to be explicitly specified by checking the checkbox below the input section.

Output The output of FindModel consists of a list of models the program has tested, and their AIC and likelihood scores. The model with the smallest AIC score is shown as 'AIC-selected model'. This model is usually the best, and limited simulations have shown that FindModel shows very little tendency to over-fitting [Tao, in preparation]. In addition to the selected model, the FindModel output also shows a matrix (Figure I-C.16) that indicates which parameters are being estimated from the data in each model. By clicking on the model name, the matrix shows every parameter that is estimated separately in a different color. In Figure I-C.16, the Jukes-Cantor model shows that all transitions and transversions have the same color (orange) and therefore are represented by one parameter. The nucleotide frequencies are all shown as f_N , so they are also all estimated to be the same.

History and context FindModel was developed as a web implementation of the Modeltest script written by David Posada and Keith Crandall [Posada & Crandall,

1998], modified by Bill Bruno with input from Carla Kuiken.

PeptGen

Purpose PeptGen enables design of overlapping peptide sets from single proteins or alignments, with output that allows either visualizing the peptides and differences between them, or produces a list for ordering the peptides.

Background The algorithm to generate the peptides is complex and can be modified by the user in many different ways. For example, "forbidden" amino acids can be excluded from the ends of the peptide because of their inimical effect on binding to the HLA molecule. Peptides beginning with Q (glutamine) are thought to be unreliable, so Q has been made the default for N-term forbidden amino acids. The offset between one peptide and the next, i.e., the "width" of each staircase, is determined by the "Overlap peptide by" parameter.

Output Figure I-C.17 shows the output for a protein fragment, where 15-mers overlapping by 11 were requested, but the amino acids G, P, E, D, Q, N, T, S and C were all disallowed at the C-terminal position.

When aligned sequences are provided as input, PeptGen creates an output that highlights the difference. This would be convenient for a situation where one wanted to design peptides to compare different subtypes, for example. To create the following peptides sets, no C-terminal amino acids were disallowed (so all peptides are length 15 except the last one, and two aligned sequences were given as input.

To generate a list of peptides ready to order, the set of peptides in Figure I-C.17 can be written out as a list with a unique ID assigned to each peptide, the peptide number, the sequence number, and a list of sequences

Figure I-C.16: Matrix showing free parameter estimation in the GTR (left) and Jukes-Cantor (right) evolutionary models.

```

that would contain the identical peptides from within the input alignment. One can request all peptides be listed, including duplicates between the two protein sequences, or that identical peptides be excluded so they don't need to be made twice.

History and context This site was designed by Charles Calef and Bette Korber [Calef *et al.*, 2001] in response to multiple requests by immunologists for help in generating peptides for epitope mapping. The request to facilitate peptide generation from alignments came from Richard Koup (NIH). Philip Goulder (Oxford) requested the ability to exclude certain amino acids from C-term positions, and Otto Yang at (UCLA) to forbid N-terminal amino acids. Andrew Bradbury (LANL) suggested calculating hydropathy for the resulting peptides, for antibody studies.

ELF—Epitope Location Finder

Purpose ELF scans a submitted protein sequence for known epitopes in our immunology database whose HLA agrees with the submitted HLAs.

Background ELF was written to identify potential epitopes within larger immunologically reactive target peptides [Calef *et al.*, 2002b]. Based on a peptide and a selection of HLA alleles, any known epitopes in that peptide are retrieved from in the immunology database, with links to the database entries and references. Those epitopes whose HLA presenting molecule agrees with the submitted HLAs are flagged. Anchor residues of potential epitopes that agree with the binding motifs of the submitted HLAs are indicated. Maps can be prepared that highlight every known epitope of the submitted HLA alleles across the

HIV proteome. ELF can be used in conjunction with the Hepitope tool, which looks for enriched HLAs among people who make a reaction to the peptide in a population survey.

Output The output from ELF is very rich, so we have tried to make the page as uncluttered as possible. The first graphic on the output page is a map marking the location of the input peptide in the genome (see Figure I-C.5 in the sequence locator tool). Various links go to pages that contain:

- a list of the HLAs associated with your submitted HLA. As anchor motif information is spotty and this tool is exploratory, all related serotypes and genotypes will be incorporated in the search. For example, if the user were to enter either A2 or A*0202, all A2-related serotypes and genotypes with known anchor motifs would be examined.
- a list of all anchor motifs used in the search [Marsh *et al.*, 2000; Rammensee *et al.*, 1997, 1999]. Anchor motifs embedded in epitopes 8–11 amino acids long are considered, but larger epitopes would be missed.
- potential “epitopes” ordered by HLAs. This link takes you to a listing of possible epitopes in your peptide based on the presence of appropriately spaced anchor motifs.

A list of known CTL epitopes in the peptide (regardless of HLA type) can be useful for searching for unanticipated cross-presentation. The epitopes are linked to the corresponding records in the immunology database; these records provide information regarding escape mutations, clade specific reactions, immunodominance, etc., among epitope variants. Substitutions in the epitope relative to the query peptide are highlighted with red, and epitopes

presented by the requested HLAs are marked with a green arrow.

History and context This tool was first developed by Charles Calef, Rama Thakalapally, James Szinger, and Bette Korber [Calef *et al.*, 2002b] to attempt to define epitopes within reactive peptides to support experimental epitope mapping conducted at the University of Alabama by Richard Kaslow and Paul Goepfert [Bansal *et al.*, 2003]. Charles Calef has implemented improvements over time, incorporating new suggestions made by Carla Kuiken, Karina Yusim and Bette Korber, and Christian Brander at Harvard/MGH.

Motif Scan

Purpose Motif Scan is an HLA binding motif scanner that finds HLA anchor residue motifs within protein sequences for specified HLA serotypes, genotypes, or supertypes.

Background Two major motif libraries were used [Marsh *et al.*, 2000; Rammensee *et al.*, 1999] and the literature was surveyed for additional anchor motifs. The supermotifs incorporate anchor residues that are recognized by multiple alleles within the supertype [Sette & Sidney, 1999]. We store only anchor motifs in our libraries; to incorporate auxiliary amino acids you must input your own custom motif. The motif dictionaries we use are listed on the web, as is an abbreviated list of associations between HLA genotypes and serotypes.

Input The input for Motif Scan is obtained in two steps. The first step determines what anchor motifs are of interest. If you are interested in a functional motif or auxiliary and anchor motifs, you can input that instead, using the syntax `x[LM]xxx[K]xx[V]` where `x` allows any amino acid and determines the spacing, and locations where more than one amino acid is allowed are indicated by brackets: `L` or `M` in the second position, `K` in the sixth. The second step selects the sequences to be scanned. Predefined HIV protein sequences can be used, or you can upload your own sequences. Sequences are stripped of gaps before processing.

Output All motifs with identical search patterns are grouped together. C-terminal anchor amino acids are shown in magenta and anchor amino acids in the other positions are shown in cyan. If a given amino acid is matched by more than one motif, then it is highlighted as a C-terminal anchor amino acid. All anchor amino acids are shown in uppercase and non-anchors are lowercase. Following the sequences is a list of potential epitopes showing their positions in the input sequences. You can also

view and download the resulting sequences in fasta format where the anchor amino acids are presented in uppercase and all the remaining ones in lowercase. The potential epitopes can be also downloaded in CSV (comma-separated value) format, which can be read into a spreadsheet.

History and context This tool was first developed by Warren Kibbe, Rama Thakallapally and Bette Korber [Thakallapally *et al.*, 2001]. Since the initial publication, the tool and the motif libraries were much improved by Karina Yusim and James Szinger [Yusim *et al.*, 2004].

Hepitope

Purpose Hepitope tests for HLA alleles that are enriched in individuals that react with a set of peptides.

Background This tool can be used in the context of a population study where HLAs and Elispot reactivity are available for a set of patients. To find HLA types that may be more frequent with certain reactivity patterns, a Fisher's exact test is used to look for enriched HLAs with a two-by-two contingency table tally for each subject tallying whether each HLA is present or absent, and whether they reacted to the peptide or not. This can be used in conjunction with our ELF program, which will scan a peptide for known epitopes in the database and for anchor motifs for HLAs that are found to be enriched, thus helping to identify epitopes within a larger peptide fragment (Hopeful Epitopes, or Hepitopes). This tool is not HIV or HCV specific, except when it is used in conjunction with ELF. The output is organized by peptide, and these can be returned either in the order entered or in alphabetical order. You can have all of the data returned, including summaries of every person's HLA that did not react with the peptide in question, but the default is to display only positive reactions.

Input This tool requires two inputs. The first input (Figure I-C.22) is a text format table of patients and their HLAs (note that many patients are needed to get statistical significance). The allele can be written as a serotype (A2) or a genotype (A*0201), but if both are used then they will be treated separately in the analysis. If an HLA type is unknown, it should be written as a single character. For example, if the C alleles had not yet been determined in Patient 1, then the HLA could be written as:

```
Patient1  A*0201 A*0201 B*5703 B*1701 C C
```

The second input is a list of reactive peptides, and the patients that reacted:

```
Gag1  MGARASVLSGGELDRWEK Patient1
Gag2  SGGELDRWEKIRLRPGGK Patient2 Patient3
Gag3  EKIRLRPGGKKKYKCLKHI Patient4
```

```

Output Four columns of data that form the 2 by 2 contingency table used to compute the p-value. The output is arranged by peptide, and if the ELF integration is requested, anchor motifs and known epitopes are also summarized for each epitope.

- a The number of individuals that carry the HLA allele and react with the peptide.
- b The number of individuals that carry the HLA allele and do not react with the peptide.
- c The number of individuals that do not carry the HLA allele and react with the peptide.
- d The number of individuals that do not carry the HLA allele and do not react with the peptide.

The one-sided Fisher's exact test p-value is calculated to see if category a (number of individuals that both carry the HLA allele and react with the peptide) is higher than one would expect by chance alone. These are uncorrected p-values, and obviously multiple tests are being done, so these values should be evaluated with appropriate corrections or else the enriched HLAs for a give peptide should be considered as a hypothesis forming guideline for a suggestion of a likely HLA presenting molecule.

History and context This web-based tool and strategy for enabling epitope prediction analysis was developed by James Szinger and Bette Korber for a large epitope mapping and HLA typing project run by Christian Brander and Bruce Walker (Harvard University and Massachusetts General Hospital) [Kiepiela *et al.*, 2004].

I-C-4 Acknowledgements

We thank many of our past graduate research assistants, postdoctoral fellows, and technical support staff who contributed directly to these tools and databases, including Satish Pillai, Adam Siepel, Ashish Agrawal, Russell Richardson, Kristina Kommander, Dorothy Lang, John Mokili, Shaun Geer, Una Smith, Kersti Rock, Sampath Billikanti, Rama Thakallapally and Patrick Rose. James Theiler has often contributed valuable bits of code to this project. We particularly thank our colleagues who have made suggestions to improve these tools and the database in general.

Part II

HIV CTL CD8+ Epitopes

CTL CD8+

II-A

Summary

This part includes tables, maps, and associated references of HIV-specific CTL epitopes arranged sequentially according to the location of the proteins in the HIV-1 genome. We attempted to make this part as comprehensive as possible, requiring that the epitope be contained within a defined region of a maximum of 30 amino acids, but not that the optimal boundaries be defined. Studies that were based on the analysis of whole proteins are described at the end of each protein section. The same epitope can have multiple entries, as each entry represents a single publication in this part of the database. For more recent updates, epitope sequence alignments, and useful search capabilities, please see our web site: <http://www.hiv.lanl.gov/content/immunology>. For a concise listing of the best defined CTL epitopes, see the summary by Nicole Frahm, Christian Brander and Philip Goulder on page 3 in Part I of this compendium. CTL responses to proteins with no defined epitopes are listed at the end of each protein section.

Recent studies utilize multiple functions attributed to T cells to define responses, and the simple distinctions of cytotoxic T-cell and helper T-cells have become blurred as more is learned about the range of responses triggered in CD4 and CD8 positive T-cells responding to antigenic stimulus. When adding the most recent studies to the database, we have tried to place T cell responses in a reasonable manner into our traditional helper T cell and CTL parts, and to specify the assay used to measure the response in each study.

II-A-1 Epitope tables

Each CTL reference has a multi-part basic entry:

HXB2 location: The viral strain HXB2 (GenBank Accession Number K03455) is used as a reference strain throughout this publication. The position of the defined epitope location relative to the sequence of the HXB2 protein is indicated. The numbering in this table corresponds to the protein maps. Because of HIV-1 variation the epitope may not actually be present in HXB2; rather, the position in HXB2 indicates the position aligned to the epitope. HXB2 was selected as the reference strain because so many studies use HXB2, and because crystal structures for HXB2-related proteins are often available. The precise positions of an epitope on the HXB2 reference strain can be readily

obtained using the interactive position locator at our web site: <http://www.hiv.lanl.gov/content/hiv-db/LOCATE/locate.html>.

Author location: The amino acid positions of the epitope boundaries and the reference sequence are listed as given in the primary publication. Frequently, these positions as published are imprecise, and do not truly correspond to the numbering of the sequence, but they provide a reasonable guide to the peptide's approximate location in the protein. Also, in many cases the reference sequence identification was not provided, and in such cases it is not possible to use these numbers to specify precise locations.

Epitope: The amino acid sequence of the epitope of interest as defined in the reference, based on the reference strain used in the study defining the epitope. On occasions when only the position numbers and not the actual peptide sequence were specified in the original publication, we tried to fill in the peptide sequence based on the position numbers and reference strain. If the sequences were numbered inaccurately by the primary authors, or if we made a mistake in this process, we may have misrepresented the binding site's amino acid sequence. Because of this uncertainty, epitopes that were not explicitly written in the primary publication, that we determined by looking up the reference strain and the numbered location, are followed by a question mark in the table.

Epitope name: If the epitope has a name attributed by the publication, it is recorded here, e.g. "SL9".

Subtype: The subtype under study, generally not specified for B subtype.

Immunogen: The antigenic stimulus of the CTL response. Often this is an HIV-1 infection. If a vaccine was used as the original antigenic stimulation, not a natural infection, this is noted separately, and additional information about the vaccine antigen is provided as available.

Species (MHC): The species responding and MHC or HLA specificity of the epitope.

Donor MHC: The HLA genotype of the individual that responded to the epitope.

Country: The country where the samples were obtained—generally not specified if the study was conducted in the United States.

Assay type: Assay used to characterize the response.

Keywords: Keywords are a searchable field for the web interface that is included in the T-cell sections of the printed version to help identify entries of particular interest.

Reference: The primary reference (sometimes two or more directly related studies are included). Details for some of the earlier references are in Part V.

Following the entry for a given CTL epitope brief comments explain the context in which the epitope was studied and what was learned about the epitope in a given study.

in all sequences, a lower case letter indicates the amino acid was present in most sequences in a given position, and a question mark indicates two or more amino acids were represented with equal frequency.

II-A-2 HIV protein epitope maps

All HIV CTL epitopes mapped to within a region of 14 amino acids or less are indicated on the HIV protein epitope maps. The location and HLA restriction elements of CTL epitopes are indicated on protein sequences of HXB2. These maps are meant to provide the relative location of defined epitopes on a given protein, but the HXB2 sequence may not actually carry the epitope of interest, as it may vary relative to the sequence for which the epitope was defined. Epitopes with identical boundaries and HLA fields are included in the maps only once. If one laboratory determines HLA presenting molecules at the serotype level (example: A2) and another at the genotype level (example: A*0201) both will be included in the map. MHC specificities are indicative of the host species; when no MHC presenting molecule is defined, the host species is noted.

II-A-3 Alignments

To conserve space, no epitope alignments are provided in this book, but they can be generated using the CTL epitope search tool at <http://www.hiv.lanl.gov/content/immunology>. All epitopes are aligned to the HXB2 sequence, with the sequence used to define the epitope indicated directly above it. Sequences are sorted by their subtype and country of origin.

The master alignment files from which the epitope alignments were created are available at our web site¹. The alignments were modified in some cases to optimize the alignment relative to the defined epitope and minimize insertions and deletions; epitope alignments are generated by anchoring on the C-terminal residue. A dash indicates identity to the consensus sequence, and a period indicates an insertion made to maintain the alignment. Stop codons are indicated with a \$, and frameshifts by a #, or ambiguous codons (nucleotide was r, y, or n) by an x; they are inserted to maintain the alignments. In consensus sequences an upper case letter indicates the amino acid was present

II-B

HIV CTL Epitope Tables

All HIV CTL epitopes are arranged by protein position. The table entries are sorted in a nested way—first by protein, then by HXB2 start location and finally by HLA presenting molecule. CTL reactions against proteins with undefined epitopes are listed at the end of the protein that stimulated the response.

II-B-1 Gag p17 CTL, CD8+, epitopes

HXB2 Location p17 (5–13)
Author Location Gag (5–13 SUMA)
Epitope ASVLSGGEL
Epitope name Gag AL9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Donor MHC A*1103, A*2402, B*1402, B*1501, C*0802
Country United States.
Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay
Keywords dynamics, acute infection, characterizing CD8+ T cell responses
References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T-cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape mutations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

HXB2 Location p17 (11–19)

Keywords genital and mucosal immunity
References Musey *et al.* 2003

- CTL clones from blood, semen, cervix and rectum samples from 12 individuals were compared. CTL clones derived from blood and mucosal samples had similar high lysis efficiency, primarily perforin dependent, and TCRbeta VDJ region sequencing revealed cases of expansion of the same clone in different compartments.
- CD8+ T cell clones directed at this epitope were derived from blood and semen.

HXB2 Location p17 (16–30)
Author Location p17 (16–30 HXB2)
Epitope WEKIRLRPGGKKKYK

Subtype B**Immunogen** HIV-1 infection**Species (MHC)** human**Assay type** T-cell Elispot**Keywords** immunodominance, early treatment**References** Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STL.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- Responses to this peptide were detected in 19% of the study subjects, and it was one of the 25 most frequently recognized peptides.

HXB2 Location p17 (18-26)**Author Location** p17 (18-26 IIIB)**Epitope** KIRLRPGGK**Immunogen****Species (MHC)** human (A*0301)**Keywords** optimal epitope**References** Frahm *et al.* 2004

- C. Brander notes that this is an A*0301 epitope.

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers - high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load was also found.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects - 3/3 subjects showed a dominant response to the B*2705 epitope KRWILGGLNK.
- The subject with A*0201 had a moderately strong response to SLYNTVATL.
- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.

- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVVW, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

HXB2 Location p17 (18-26)**Author Location** p17 (18-26 SF2)**Epitope** KIRLRPGGK**Immunogen** HIV-1 infection**Species (MHC)** human (A*0301)**References** Altfeld *et al.* 2001a

- HIV+ individual AC-06 was tested for reactive overlapping peptides spanning all HIV-1 proteins in an ELISPOT and was found to react with 12 peptides from 7 proteins, suggesting that the breadth of CTL responses are underestimated if accessory proteins are not included in the study.
- The reactive peptide p17 gag WEKIRLRPGGKKKYK contained two A*0301-restricted epitopes, KIRLRPGGK and RL-RPGGKKK A*0301.

HXB2 Location p17 (18-26)**Author Location** p17 (18-26)**Epitope** KIRLRPGGK**Subtype B****Immunogen** HIV-1 infection**Species (MHC)** human (A*0301)**Assay type** CD8 T-cell Elispot - IFN γ , CD8 T-cell Elispot granzyme B**Keywords** Th1, characterizing CD8+ T cell responses**References** Kleen *et al.* 2004

- Only 20% of CD8+ T-cells produce IFN-gamma and granzyme B simultaneously (Tc1a). Two additional subpopulations of HIV specific CD8+ cells are found, each one constituting 30-40% of the CD8+ cell pool. One of these (Tc1b) secretes IFN-gamma only, and the other one (Tc1c) secretes GzB only.
- Two of seven patients responded to this peptide with GzB producing cells, while none of the patients responded with IFN-gamma producing cells.

HXB2 Location p17 (18-26)**Author Location** p17 (18-26 IIIB)**Epitope** KIRLRPGGK**Immunogen** HIV-1 infection**Species (MHC)** human (A3)**Keywords** responses in children, mother-to-infant transmission, escape**References** Wilson *et al.* 1996

- Epitope defined in the context of the Pediatric AIDS Foundation ARIEL Project, a mother-infant HIV transmission study.
- KIRLRPGGR and RIRLRPGGR, naturally occurring variants, were found in mother and are escape mutants.

HXB2 Location p17 (18-26)**Author Location** p17 (18-26)**Epitope** KIRLRPGGK**Immunogen** in vitro stimulation or selection**Species (MHC)** human (A3)**Keywords** dendritic cells**References** Zarling *et al.* 1999

- This study compares the ability of macrophages and dendritic cells to stimulate primary responses in CD8+ lymphocytes isolated from HLA-appropriate HIV-uninfected donors using peptide-pulsed APC – the dendritic cells performed better as APC for the stimulation of primary responses.
- Strong CTL responses were elicited by the epitopes DRFYK-TLRA and GEIYKRWII when presented by either immature or mature dendritic cells – macrophages were not able to prime a CTL response against DRFYKTLRA.
- A weak response to KLTPLCVSL was stimulated using macrophages as the APC.
- No detectable response was observed for the following previously-defined HIV epitopes: KIRLRPGGK, ILKEPVHGV, IRLRPGGK, GPKVKQWPL.

HXB2 Location p17 (18–26)
Author Location Gag (18–26)
Epitope KIRLRPGGK
Immunogen HIV-1 infection
Species (MHC) human (A3)
References Brodie *et al.* 1999

- The ability of CTL effector cells was studied by expanding autologous HIV-1 Gag-specific CTL *in vitro*, and adoptive transfer.
- The transferred CTLs migrated to the lymph nodes and transiently reduced circulating productively-infected CD4+ T cells, showing that CTL move to appropriate target sites and mediate anti-viral effects.

HXB2 Location p17 (18–26)
Author Location (18–26)
Epitope KIRLRPGGK
Immunogen HIV-1 infection

Keywords epitope processing, immunodominance, escape, acute infection, characterizing CD8+ T cell responses, reversion, viral fitness

References Allen *et al.* 2004

- KK9 and RK9 overlap, are presented by HLA-A3, and are frequently immunodominant and involved in acute-phase primary responses. A mutation in the C-terminal flanking residue of KK9 (K to Q) (kirlrpkkq-Q) inhibits processing of the immunodominant gag KK9 epitope, resulting in rapid decline in the KK9 specific CD8+ T-cell response. At the same time it abrogates the response to RK9 through the embedded mutation rlrpggkQk. Transmission of this mutation to patients expressing HLA-A3 prevents acute-phase response to these epitopes, although the mutation can eventually revert to wild-type allowing a delayed response to the epitope.

References Altfeld *et al.* 2002a

- An HIV+ individual given acute ARV and undergoing STI developed a strong CTL immune response, but despite this was shown to be superinfected with second B clade virus. Some epitope variants of the second infecting virus were resistant to the initial CTL response. This epitope did not vary, although the response declined over time. The authors suggest this might be due to a downstream Arg \rightarrow Thr substitution at C+2 that may impair processing.

HXB2 Location p17 (18–27)

Author Location (C consensus)

Epitope KIRLRPGGKK

Subtype C

Immunogen HIV-1 infection

Species (MHC) human (A*0301)

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cell responses

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.

- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Epitope KIRLRPGGKK

Epitope name 1272

Subtype multiple

Immunogen HIV-1 infection

Species (MHC) human (A11)

Country United States.

Assay type T-cell Elispot

Keywords binding affinity, computational epitope prediction, cross-presentation by different HLA

References De Groot *et al.* 2003

- Epitopes defined using sequence parsing and matching algorithm Conservatrix, and epitope prediction tool EpiMatrix, were shown to be conserved in a broad range of HIV-1 sequences derived from different parts of the world. 31 novel highly conserved HIV-1 epitopes were found, among which four were recognized as promiscuous epitopes and five as MHC supertypes.
- Estimated binding probability for KIRLRPGGKK: 36%. This epitope has been previously reported to be presented by A3, B27, B62, Bw62 and is an A11 binder, but was not confirmed as a CTL target in this study.

HXB2 Location p17 (18–27)

Author Location p17 (18–27)

Epitope KIRLRPGGKK

Immunogen HIV-1 infection

Species (MHC) human (A3)

Country Spain.

Assay type proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric CTL assay

Keywords HAART, ART, supervised treatment interruptions (STI), immune dysfunction

References Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong T-helper cell responses. Only patients starting with moderately high viral load (VL) were able to reduce the VL set point. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up.
- 8/14 patients recognized this epitope.

Epitope RLRPGGKKK
Immunogen HIV-1 infection
Species (MHC) human (A*0301)
Keywords acute infection
References Wilson *et al.* 2000a

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load was also found.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWILGGLNK.
- The subject with A*0201 had a moderately strong response to SLYNTVATL.
- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.
- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PIIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

Keywords class I down-regulation by Nef

References Lewinsohn *et al.* 2002

- CTL kill targets through releasing perforin, that forms pores in the plasma membrane, and granzymes, that induce apoptosis.
- Vpr is capable of arresting infected cells in the G2 phase, and it was hypothesized that Vpr may inhibit CTL-mediated apoptosis because it interacts with the granzyme B molecular complex.
- Vpr expression in the target cell did not inhibit epitope specific lysis – neither perforin or granzyme mediated events were inhibited, as measured by a Chromium release assay and a TUNEL assay.
- In contrast, deletion of Nef, which is thought to protect primary HIV infected cells by down-regulating cell-surface expression of MHC class I complexes, increased the susceptibility of HIV-1 infected cells to CTL mediated killing 2-fold using the TUNEL assay.

Assay type CD8 T-cell Elispot - IFN γ

Keywords acute infection, early-expressed proteins

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of responses and the abundance

of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.

- This epitope was recognized in four individuals during early infection, each time presented by A3.
- All HIV-1 proteins except Vpu were recognized, and responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Assay type CD8 T-cell Elispot - IFN γ
Keywords HIV exposed persistently seronegative (HEPS)
References Koning *et al.* 2004
- A high-risk seronegative group of 29 homosexual men showed reduced cellular in vitro susceptibility for HIV infection and enhanced production of RANTES compared to 15 men who went on to seroconvert. Significantly higher frequencies of HLA A*11, A*31 and Cw*15 were also found in the high risk seronegative men. Both groups of men had low frequencies of HIV-1 specific CD8+ T-cells, which may signify exposure more than protection from infection.
 - 0/5 HLA A3+ infection-resistant men, and 0/3 pre-seroconversion men who went on to become infected, reacted to this epitope.
- HXB2 Location** p17 (20–28)
Author Location Gag (20–28)
Epitope RPRPGGKKK
Immunogen HIV-1 infection
Species (MHC) human (A3)
Assay type cytokine production, proliferation, CD8 T-cell Elispot - IFN γ , Tetramer binding, Intracellular cytokine staining, Flow cytometric CTL assay
Keywords HAART, ART, memory cells, characterizing CD8+ T cell responses
References Daniel *et al.* 2004
- CD4+ and CD8+ responses in chronically HIV-1 infected patients on HAART were weak with decreased polyclonality. Only 33% of patients had CD4+ T-cells that could proliferate, and only 22% had HIV-specific CD8+ T-cell responses, and those rare responses showed low perforin levels and persistent expression of CD27, indicating incomplete differentiation and loss of lytic function.
- HXB2 Location** p17 (20–28)
Author Location p17 (20–28 B consensus)
Epitope RLRPGGKKK
Epitope name RK9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A3)
Country United States.
Assay type CD8 T-cell Elispot - IFN γ , Flow cytometric CTL assay
Keywords immunodominance, escape, acute infection, characterizing CD8+ T cell responses, reversion, viral fitness
References Allen *et al.* 2004
- KK9 and RK9 overlap, are presented by HLA-A3, and are frequently immunodominant and involved in acute-phase primary responses. A mutation in the C-terminal flanking residue of KK9 (K to Q) (kirlpkkg-Q) inhibits processing of the immunodominant gag KK9 epitope, resulting in rapid decline in the KK9 specific CD8+ T-cell response. At the same time it abrogates the response to RK9 through the embedded mutation

rlrpggkQk. Transmission of this mutation to patients expressing HLA-A3 prevents acute-phase response to these epitopes, although the mutation can eventually revert to wild-type allowing a delayed response to the epitope.

Subtype C

Immunogen HIV-1 infection

Species (MHC) human (A*2301, A*2402)

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ

Keywords cross-presentation by different HLA, characterizing CD8+ T cell responses

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression was also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.

- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Assay type CD8 T-cell Elispot - IFN γ
Keywords supervised treatment interruptions (STI), acute infection
References Montefiori *et al.* 2003

- HIV-1 + patient AC10 underwent early HAART treatment, which was discontinued 1.5 years later. At this timepoint potent NAb responses against autologous virus were detected. Treatment interruption initially induced weak CD8+ responses directed against 5 epitopes. By days 873d and 923d the CTL response had broadened to target 22 epitopes; of these six were fully characterized. Eventually the virus escaped the NAb response, but escape was not accompanied by a rise in viral load, and the authors suggest the virus was contained by the CTL response.

Epitope KYRLKHLVW
Subtype A
Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (Cw4)
Keywords HIV exposed persistently seronegative (HEPS), immunodominance
References Kaul *et al.* 2001a
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
 - Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
 - 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
 - Among HLA-Cw4 women, 2/2 HEPS and 7/11 HIV-1 infected women recognized this epitope.
 - The dominant response to this HLA allele was to this epitope in both of the 2/2 HEPS cases and in 3 of the 7/11 HIV-1 infected women.
- HXB2 Location** p17 (28–36)
Author Location p17 (28–36)
Epitope KYRLKHLVW
Immunogen HIV-1 infection
Species (MHC) human (Cw4)
References Appay *et al.* 2000
- This epitope is newly defined in this study.
 - Combined tetramer and intracellular cytokine staining was used to study the function of circulating CD8+ T cells specific for HIV and CMV.
 - HIV-specific CD8+ T cells expressed lower levels of perforin than CMV-specific CD8+ T cells from the same donor, and this was associated with persistent CD27 expression on HIV-specific cells, suggesting impaired maturation.

- In most donors, between 50% and 95% of the activated virus-specific CD8+ T cells produced IFN- γ and MIP-1 β with a distinct subset that failed to produce TNF- α .

References Addo *et al.* 2003

- Comprehensive elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 were chronically infected and treated; 22 started treatment during acute infection; 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2–42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.

References Chitnis *et al.* 2003

- 17 perinatally HIV-1 infected children (0.08–16 years) were evaluated for HLA-A2-restricted IFN-gamma CD8+ CTL responses against 4 immunodominant peptides that carry HLA-A2 epitopes. Two peptides were from gp120 (one at position 112, one from the V3 loop), and one each was from gp41 and Gag. 15/17 patients responded to the Gag peptide, 13/17 to the gp41 and the non-V3 gp120 peptides, and 11/17 responded to the V3 loop. 4 children recognized all 4 peptides.
- In 10/14 children, addition of exogenous IL-15 induced increased frequencies of SFCs to the Gag peptide. IL-2 and IL-7 did not increase SFCs, however IL-2, IL-7 and IL 15 could all increase the intensity of the spots in some patients. In 4 children, IL-15 addition brought the SFC response up to the level of detection.

Epitope RLSYNTVATLY

Immunogen**Species (MHC)** human (A*3002)**References** Novitsky *et al.* 2001

- This study provides a survey of CTL responses and full length HIV-1 genome sequences from a C subtype infected Botswana cohort.
- Only 3/13 (23.1%) A*3002-positive subjects demonstrated moderate CTL responses to the peptide GTEELRSYNTVAT-LYCVHE (residues 71 to 90), which contains the previously described A*3002 epitope RLSYNTVATLY.

HXB2 Location p17 (76–86)**Author Location** p17 (76–86)**Epitope** RSLYNTVATLY**Epitope name** RY11 (p17)**Immunogen** HIV-1 infection**Species (MHC)** human (A*3002)**References** Goulder *et al.* 2001a

- HLA-A*3002 is very common in African populations, 50% of Zimbabweans express HLA-A30, 44% in African Zulu, so five new HIV epitopes were characterized that are presented by this HLA molecule.
- A rapid method was developed combining ELISPOT with intracellular IFN- γ staining of PBMCs to map optimal epitopes, then HLA presenting molecules were defined – this method was completed within 48 to 72 hours of receipt of blood.
- Two individuals were studied: Subject 199 (HLA A*0201/*3002 B*4402/51 Cw2/5), a Caucasian, and Subject 6007 (HLA A*3002/ B53/*5801 Cw4/7) an African-Caribbean.
- In both HLA-A*3002 individuals the response to RSLYNTVATLY was dominant.
- Three quantitative assays, ELISPOT, precursor frequency and chromium release, confirmed a hierarchy of response: RY11 (p17) > KY9 (gp41) > KY9 (RT-53) > IY9 (gp41).
- HLA-A*3001-positive targets do not present RSLYNTVATLY.

- This study monitored epitope responses in HIV-1 infected minority women living in the United States.
- 24 epitopes were described – 8 were novel, 8 used new restricting elements but were previously defined epitopes, and 8 were previously described.
- Serial peptide truncations were used to define optimal epitopes for CTL cell lines isolated from 12 individuals, assayed by a Cr-release.

- Subject 00RCH33 was on HAART had a viral load of 2900 and CD4 count of 727 and also recognized the epitopes YPLTFG-WCY, Nef(135-143), HLA B*5301; AETFYVDGA, RT(437-445), HLA B*4501; and HIGPGRAF, gp160(310-318), HLA A*3002.

- Among HIV+ individuals who carried HLA B30, 3/16 (19%) recognized this epitope.

HXB2 Location p17 (76–86)**Author Location** (C consensus)**Epitope** RSLYNTVATLY**Subtype** C**Immunogen** HIV-1 infection**Species (MHC)** human (A*3002)**Country** South Africa.**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** characterizing CD8+ T cell responses**References** Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location p17 (76–86)**Author Location** p17 (74–86 SF2)**Epitope** RSLYNTVATLY**Immunogen** HIV-1 infection**Species (MHC)** human (A30)**Keywords** HAART, ART, acute infection**References** Altfield *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-A30+ individuals that had a CTL response to this epitope broken down by group: 0/1 group 1, 0/0 group 2, and 1/1 group 3.

Donor MHC A30, A32, B18, B27
Keywords HAART, ART, supervised treatment interruptions (STI)
References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8+ T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient D displayed the greatest response to B27-KK10 (p24), and also responded to A30-RY11(p17), A32-PW10(RT), A30-KY11(RT), A32-RW10(gp120), and B18-YY9(Nef).

Epitope SLYNTVATL
Epitope name SL9
Subtype B
Immunogen HIV-1 infection
Species (MHC)
Keywords rate of progression, escape
References Douek *et al.* 2002

- Seven HIV-positive subjects tended to make their strongest CD8+ T-cell response against Gag; these responses had varying breadth and magnitude that were unrelated to disease progression.
- Patient TX7 primarily recognized SL9 during a three year study period and used six T-cell clonotypes for this recognition.
- SLYNTVATL was the only form of the epitope found initially, but three alternate forms eventually appeared: SLYNTVAVL, SLYNTIATL, and most commonly SLYNTIATL. These distinct forms bind A2, but have distinct abilities to stimulate different T-cell clonotypes.
- In subject TX7, the observed mutations of SL9 failed to escape overall CTL recognition, presumably because the six T-cell clonotypes allowed a more flexible response.
- The BV17 T-cell clone recognized SL9 but not SLYNTIATL, and BV17 became undetectable at week 20 when SLYNTIATL predominated. Subsequently BV17 became the second most common clone. Thus the relative frequency of the T-cell clonotypes varied with respect to each other and to epitope variation.

Epitope SLYNTVATL**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human**Donor MHC** A*0201**Keywords** HAART, ART, responses in children**References** Luzuriaga *et al.* 2000

- Longitudinal study of 8 infants with prolonged viral suppression due to combination antiretroviral therapy showed no HIV-1 specific CTL responses in peripheral blood cells. 6/8 were studied using a Chromium release assay and no response was detected using Gag expressed in vaccinia in the target cells. Three HLA-A*0201 children were tested using SLYNTVATL or ILKEPVHGV HLA A*0201 tetramers and again no HIV-specific response was detected, either using PBMC specimens, or PBMC which had been stimulated *in vitro* for a week.
- In contrast, one of the children with therapy suppressed HIV viral replication who was co-infected with HIV and EBV, while HIV-tetramer negative, had EBV-tetramer staining cells at a frequency of 0.14% in the PBMC.

HXB2 Location p17 (77–85)**Author Location** p17 (77–85)**Epitope** SLYNTVATL**Immunogen** HIV-1 infection**Species (MHC)** human (A*02)**Keywords** HAART, ART**References** Huang *et al.* 2000

- The single cell ELISPOT assay was optimized and highly specific, and found to work well even after the primary cells had been frozen and thawed.
- Increases in gamma IFN producing cells were observed in response to anti-retroviral therapy using single cell IFN-gamma-production ELISPOT.
- 4/8 A*02 subjects had a positive response to this epitope indicating that it is a major epitope for CD8+ gamma IFN production.
- In 3/3 HLA A*02, B*27 individuals, the dominant response in gag measured by both gamma IFN production and T-cell lysis was a B27 epitope, p24(263-272), not the A2 SLYNTVATL epitope.

HXB2 Location p17 (77–85)**Author Location** p17 (77–85)**Epitope** SLYNTVATL**Epitope name** SL9**Immunogen** HIV-1 infection**Species (MHC)** human (A*02)**Keywords** HAART, ART**References** Rinaldo *et al.* 2000

- Administration of triple-drug antiretroviral therapy (IDV, 3TC and ZDV) sometimes showed a transient increase and other times failed to increase CTL responses in patients with advanced HIV disease, but there is a stable population of tetramer stained HIV-specific CD8+ CD45RO+ cells that can persist after therapy and long periods of virus being below the level of detection.

HXB2 Location p17 (77–85)**Author Location** p17**Epitope** SLYNTVATL**Epitope name** SL9**Immunogen** HIV-1 infection**Species (MHC)** human (A*02)**Keywords** HAART, ART, immunodominance**References** Scott-Algara *et al.* 2001

- This study examined with CTL response in HLA A*02+ children by tetramer staining for HLA-A2 immunodominant epitopes SLYNTVATL and ILKEPVHGV.
- 71% of the 28 HIV-1 infected HLA-A*02 positive children recognized both epitopes, with cells from 26 children stained positive by the gag tetramer (SLYNTVATL) and 21 children by the pol tetramer (ILKEPVHGV)
- There were no differences observed in children that had therapy versus those that did not.
- Tetramer-binding cells were memory activated CD28-, CD45RO+, CD45RA- HLADR+, CD69-, CD8+ T-cells.

HXB2 Location p17 (77–85)**Author Location** p17 (77–85 HXB2)**Epitope** SLYNTVATL**Epitope name** SL9**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A*0201)**Keywords** epitope processing, immunodominance, escape**References** Brander *et al.* 1999

- Multiple natural variations in the SL9 flanking regions of the immunodominant epitope SLYNTVATL were tested and found not to adversely affect CTL recognition or prevent epitope processing, suggesting that viral escape from the HLA-A*0201-restricted CTL response against SLYNTVATL is probably not linked to variations in the flanking regions of this epitope.
- The substitution Y79F was an escape mutation in that it interfered with CTL recognition by one CTL clone from an A*0201 infected individual, clone 13010.B17, but it was still recognized by another CTL clone, 115.D4.

HXB2 Location p17 (77–85)**Author Location** p17**Epitope** SLYNTVATL**Immunogen** HIV-1 infection**Species (MHC)** human (A*0201)**Keywords** acute infection**References** Wilson *et al.* 2000a

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T-cells and viral load was also found.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWIIIGGLNK.

- The subject with A*0201 had a moderately strong response to SLYNTVATL.
- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.
- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PIIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMY, B35-DPNPQEVVL.

Immunogen HIV-1 infection

Species (MHC) human (A*0201)

Keywords rate of progression, immunodominance

References Hay *et al.* 1999

- CTL response to IPRRIRQGL was the immunodominant response in a rapid progressor – there was a subdominant response to SPAIFQSSM in Pol, and interestingly, no response to commonly immunodominant HLA A*0201 epitope SLYNTVATL, although this individual was HLA A*0201.
- The individual showed a strong initial CTL response at the time of the initial drop in viremia, but it was quickly lost, although memory cells persisted.
- Despite the initial narrow response to two epitopes, no other CTL responses developed.
- No HIV-specific lymphoproliferative responses were detected in this patient, and neutralizing antibody response was weak.

- A variant of this epitope was observed *in vivo* (–F—V–), but this mutation is recognized by SLYNTVATL-specific CTL, and in this case the patient's cells could present the peptide to SLYNTVATL-specific CTL.

Keywords inter-clade comparisons, computational epitope prediction, vaccine-specific epitope characteristics, escape

References Schönbach *et al.* 2002

- Computational methods (artificial neural networks [ANN], hidden Markov models [HMM], binding matrices based on HLA association rates BIMAS) were used to identify HLA-A*0201 and HLA-B*3501 HIV T-cell epitope candidates from 533 Gag, Env and Pol sequences of which 374 were derived from HIV-1, 97 were derived from HIV-2 and 62 from SIV. Comparisons to known epitopes and between clades were made.

- The SLYNTVATL epitope received focused discussion. SLYNTVATL, sIFntvatl, slyntvaVI, and slyntIaVI are all recognized variants, ANN predicts all four variants would be recognized, while BIMAS only predicts SLYNTVATL and sIFntvatl would be recognized. However, Sewell *et al.* [1997] suggested certain substitutions may be antagonistic, including sIFntvatl, and vaccines do not stimulate SLYNTVATL responses as well as natural infections. The authors note these kinds of issues complicate the application of computational predictions of epitopes to vaccine design.

References Imami *et al.* 2002b

- 70 patients with chronic disease progression, 10 clinical non-progressors, and 3 immunologically discordant progressors (individuals who controlled viremia but had progressive CD4+ T-cell decline) were analyzed for their T-helper cell responses to p24 and cytokine profile. Long term non-progressors had much stronger Th responses, particularly to p24 peptides, and they tended to be balanced between Th1, IL-2 producing and Th2, IL-4 producing responses.

- One of the immunologically discordant progressors became symptomatic during the course of the study, and he had a rapid drop in proliferative response to all antigens and also a shift from a Th1 to a Th2 response. To find out if the CD8 response also shifted in cytokine production, the CD8+ T-cell response to SLYNTVATL in this patient was also tested. It too was found to shift, from IFNgamma to IL-4 producing in Elispot, and using a bioassay of indicator lines, from IL-2 to IL-4 production.

References Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15–92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- Only 1/10 HLA A*02 carrying individuals in this study recognized SLYNTVATL.
- All HIV-1 proteins except Vpu were recognized, and responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

References Jamieson *et al.* 2003

- Epitope escape mutations in chronically infected individuals developed over several years indicating selective advantage of escape mutants. The maturation state of CTLs appear to affect the rate of epitope mutation and CTL decay.
- In two patients, SL9-specific CTL peaked at 2–4 years post-infection; at that point the escape mutations began to dominate followed by CTL decline with a 6 month lag, suggesting CTL decline resulted as a consequence of escape. In a third patient, the initial response was 1/2 as strong and mutations did not arise until 6–7 years post-infection; in that case the decline in SL9 CTL preceded epitope mutation.
- Two patients HLA-A*0201 started out with a non-consensus sequence, sIFntvatl. In one of the patients, a transient reversion to the consensus was observed after 4 years, that did not reappear until the 11th year, suggesting the possibility that a reversion to the consensus form occurred, but a CTL response may have limited it so that this more fit form could not re-assert itself until the patient had a more severely compromised immune response.

Keywords vaccine-specific epitope characteristics, immunodominance, characterizing CD8+ T cell responses

References Ferrari *et al.* 2004

- Thirteen HLA-A*0201 vaccines with anti-Gag CD8+ CTL reactivities were tested in uninfected HIV vaccine recipients to examine the pattern of SL9 epitope immunodominance. None of the vaccines had a detectable anti-SL9 response, in contrast to 75% of HLA A*0201 chronically infected HIV+ individuals that respond to this epitope.

Author Location p17

Epitope SLYNTVATL

Epitope name SL9

Immunogen HIV-1 infection

Species (MHC) human (A*0201)

Keywords review, rate of progression, escape, acute infection

References Goulder & Watkins 2004

- This paper is a review of the role of CTL in HIV infection, and it uses SL9 as an example of an epitope that is not responded to early in infection, yet 75% of HIV+ people respond to SL9 during chronic infection. Despite the delay in response, strong SL9 responses have been associated with lower viral loads, and escape mutations arise.

HXB2 Location p17 (77–85)

Epitope SLYNTVATL

Subtype C

Immunogen HIV-1 infection

Species (MHC) human (A*0201)

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cell responses

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Immunogen HIV-1 exposed seronegative

Species (MHC) human (A*0214, A*0201)

References Kaul *et al.* 2000

- 11/16 heavily HIV exposed but persistently seronegative sex-workers in Nairobi had HIV-specific CD8 gamma-IFN responses in the cervix – systemic CD8+ T cell responses tended to be to the same epitopes but at generally lower levels than cervical CD8+ T cell responses.
- Low risk individuals did not have such CD8+ cells.
- CD8+ T cell epitopes: DTVLEDINL (3 individuals), SLYNTVATL (4 individuals), LSPRTLNAW (3 individuals) and YPLT-FGWCF (4 individuals) were most commonly recognized by the HIV-resistant women.
- The epitope variants SLYNTVATL and SLFNTVATL were both recognized.

HXB2 Location p17 (77–85)
Author Location Gag (77–85)
Epitope SLYNTVATL

Immunogen Vaccine

Vector/Type: vaccinia

Species (MHC) human (A2)

References Woodberry *et al.* 1999

- A polyepitope vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2.
- HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D^d – this transgene is the only MHC molecule expressed in the mice.
- CTL responses to Gag (77–85) SLYNTVATL, Pol (476–484) ILKEPVHGV, gp120 (120–128) KLTPLCVTL, and Nef (190–198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost.
- No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157–166 (PLTFGWCYKL), Pol 346–354 (VIYQYMDDL), and Nef 180–189 (VLEWRFD-SRL).
- Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested.
- SLYNTVATL was recognized by 5/16 HLA-A2 patients.

Epitope SLYNTVATL
Immunogen Vaccine

Vector/Type: canarypox *Strain:* B clade LAI, B clade MN *HIV component:* Gag, gp120, gp41, Protease

Species (MHC) human (A2)

Keywords immunodominance

References Carruth *et al.* 1999

- The vaccine used was a live recombinant canarypox (CP) virus vaccine containing multiple HIV-1 genes (HIV-1 MN gp120, HIV-1 LAI gp41, HIV-1 LAI Gag, HIV-1 LAI protease).
- CD4+ and CD8+ Gag and Env specific CTL responses were detected in only 1/5 vaccinated volunteers, and were not detectable 1 year after vaccination.
- CTL responses to epitopes SLYNTVATL and TVYYGVPVWK from HIV+ control patients were used as positive controls.
- The study explored why vaccinees were non-responsive – non-response was not due to inherent defects or differences in the ability of these individuals to process and present antigen.
- Lack of response to SLYNTVATL led the authors to speculate that the immunodominance of this epitope in natural infections may not be recapitulated by vaccine antigen.

Epitope SLFNTVATL

Immunogen HIV-1 infection, HIV-1 exposed seronegative

Species (MHC) human (A2)

Keywords inter-clade comparisons, HIV exposed persistently seronegative (HEPS), immunodominance

References Kaul *et al.* 2001a

- Variants SL(F/Y)NTVATL are A/B clade specific.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.

- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-A2 women, 1/10 HEPS and 22/26 HIV-1 infected women recognized this epitope, likelihood ratio 18.3, p value < 0.003, and ILK(D/E)PVHGV tended to be more reactive in HEPS women, SL(F/Y)NTVATL in infected women.
- The dominant response to this HLA allele was to this epitope in the 1/10 HEPS case and in 18 of the 22/26 HIV-1 infected women that responded.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.
- Subject ML 1250 had an A2 response to ILK(D/E)PVHGV prior to seroconversion, which switched to SL(F/Y)NTVATL post-seroconversion.
- Subjects ML 1575 and ML 1592 had no response to SL(F/Y)NTVATL prior to seroconversion, but made responses post-seroconversion.
- Subject ML 1760 had an A2 response to ILK(D/E)PVHGV prior to seroconversion, and gained responses to epitopes A2 SL(F/Y)NTVATL and B27 KRWII(L/M)GLNK post-seroconversion.

Keywords rate of progression, acute infection

References Day *et al.* 2001

- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)
- 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.
- SLYNTVATL was the dominant A2 epitope recognized in patients with chronic infection, except for Subject 11841 who recognized 5/8 epitopes.
- Three subjects had an A2 response only to SLYNTVATL.
- The two subjects with acute infection did not respond to SLYNTVATL.

Epitope SLYNTVATL

Immunogen HIV-1 infection

Species (MHC) human (A2)

Keywords epitope processing

References Cohen *et al.* 2002

- The antigen presentation of two A2-restricted epitopes was compared, SLYNTVATL (p17) and ILKEPVHGV (RT). HIV-1 infected cells were more sensitive to lysis by SLYNTVATL-specific CTL than by ILKEPVHGV-specific CTL, because of a higher density of SLYNTVATL-A2 resulting from differences in processing.
- Incubation with a T1-cell proteolytic extract showed that by four hours, 25% of a p17 peptide had a C-term Leu-85 and were SLYNTVATL-precursors, while ILKEPVHGV-precursors were far less frequent (6.8%) even with four times more proteolytic extract after 30 hours.
- p17 was preferentially cleaved between Leu85 and Tyr86, while appropriate Val484 and Tyr485 cleavage was minor for RT.
- In a competition experiment, RSLYNTVATL bound TAP 3.7-fold more efficiently than RT peptides.
- No difference in CTL avidity was detected in six patients with HLA-A2-restricted responses to these epitopes.
- No significant difference in HLA-A2 binding to p17 or RT epitopes was observed.

Immunogen HIV-1 infection

Species (MHC) human (A2)

Assay type Chromium-release assay, Flow cytometric CTL assay

Keywords class I down-regulation by Nef

References Bobbitt *et al.* 2003

- Nef, through Nef-mediated MHC-I down-regulation, is not the only viral protein to influence levels of HIV-specific CTL recognition. The Rev L60F mutation, a common natural variant, can decrease CTL recognition of late gene products. The Rev mutation impacts the early to late gene switch, reducing late gene product production (Gag, Pol, Env, Vpu, Vpr and Vif), while increasing Nef production, both of which reduce the impact CTL recognition of late gene products. As expected, Rev L60F rendered HIV infected cells more resistant to CTL that recognized epitopes from the late proteins Env and Gag. Gag expression is reduced more than Env, and Gag-specific CTL were more profoundly affected. Conversely CTL against an epitope in an early gene product, Tat, were more efficiently recognized when infected with viruses carrying the Rev L60F mutation.
- Patients in the asymptomatic phase with active immune responses had more CTL resistant viruses, with lower Rev activity, lower Gag expression and greater resistance to Gag-specific CTL killing, while viruses isolated from people with AIDS were more sensitive to CTL killing.

Keywords responses in children
References Sandberg *et al.* 2003
- 65 vertically HIV-1 infected children, ages 1–16, the majority undergoing ART, were analyzed in regard to their plasma viremia and CD4+ and CD8+ T-cell counts, and CD8+ T-cell responses.
 - Using vaccinia expressed Gag, Pol, Env, Rev, Nef in target cells in an Elispot assay, 85% of the children recognized at least one HIV antigen. Strong CD8+ T-cell responses were directed against Pol, followed by Gag and Nef. Children younger than 4 had significantly weaker responses (7/14 had no response) than older children (only 1/32 had no response, and responses were greater in magnitude).
 - SLYNTVATL and ILKEPVHGV tetramers were used to quantitate specific responses. 49 children in an expanded cohort carried HLA-A2. 1/11 children under 3 years of age had detectable CD8+ T-cell responses to SLYNTVATL, 2/11 to ILKEPVHGV. Among children over 3, 11/38 recognized SLYNTVATL and 9/38 recognized ILKEPVHGV.
 - Older children that maintained a CD4 count greater than 400 cells/ul tended to have stronger CTL responses.

Assay type cytokine production, CD8 T-cell Elispot - IFN γ , Tetramer binding, Intracellular cytokine staining
Keywords assay standardization/improvement, memory cells
References Sun *et al.* 2003
- This study compares assay methods for testing CTL responses using samples from 20 HIV+ patients. The study compares ELISpot, tetramer-binding, and intracellular IFN γ . Tetramer-binding analysis was performed with Gag (SLYNTVATL) or Pol (ILKEPVHGV) tetramers. Antigen presentation using recombinant vaccinia viruses (rVVs) encoding HIV-LAI Gag,

Pol, Env, Nef, Tat and Vif proteins was compared to peptide panels. HIV antigen recognition in memory CTLs was measured by chromium release assay and compared to effector/memory CD8+ T-cells in an IFN- γ ELISpot assay.

- Results: IFN γ Elispot and flow cytometry gave similar frequencies of HIV specific CD8+ T-cells. Tetramer-binding analysis was most sensitive. Pools of peptides and the sum of frequencies of individual peptides were comparable. Elispot assays using peptides were more sensitive than assays using vaccinia expressed proteins. Cr release and Elispot against rVVs gave comparable memory cell responses 2/3s of the time.
- 3/7 HLA-A2+ patients recognized this epitope.

Epitope SLYNTVATL

Epitope name SL9

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A2)

Assay type Chromium-release assay, CTL suppression of replication

Keywords escape, TCR usage

References Yang *et al.* 2003a

- Virus was cultured in the presence of CTL lines specific for 5 different epitopes (SLYNTVATL, ILKEPVHGV, IEIKDTKEAL, SEGATPQDL, and KEKGGLEGL) to study the emergence of escape mutations. Escape varied between clones for the same epitope, and between different epitopes. Gag and RT epitope escape, if it occurred at all, tended to be monoclonal and within the epitope, indicating strong fitness constraints, while the Nef epitope escape was rapid, polyclonal, and sometimes the result of upstream frameshifts.
- Three CTL clones were studied that recognized SLYNTVATL, 161JxA14, 18030D23, and 115DEC4. The different TCR usage on the CTL clones resulted in different patterns of recognition and escape. 161JxA14 suppressed the variant sIFntvatl, 18030D23 did not; conversely the variants sIFntIaVI and sIFntIatl were suppressed by 18030D23, but not 161JxA14.
- After two weeks of passage the predominant escape mutant from 161JxA14 was slyntIatl. Amino acid residues flanking SL9 were unchanged. Escape mutations did not occur within two weeks for the two additional SL9-specific CTL clones 18030D23 and 115DEC4.

Assay type CD8 T-cell Elispot - IFN γ

Keywords variant cross-recognition or cross-neutralization

References Draenert *et al.* 2004c

- CD8+ T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2–39) epitopic regions were targeted in an average of 6 proteins (range, 1–8). HAART resulted in decrease in antigen and reduction in gamma IFN EliSpot responses, suggesting active responses to autologous virus. Limited or no mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.
- Three subjects recognized this epitope, with high functional avidity. Relative to consensus, two individuals that had the SLYNTVATL epitope carried a R \rightarrow K mutation proximal to but outside the epitope; possible processing implications were not studied here.

- References** Yang *et al.* 2003b
- Killing efficiency of CTLs and their ability to suppress viral replication is shown to depend more on epitope specificity than to antigenic avidity. Different clones recognizing the same epitope had similar killing efficiency despite their variation in avidity. Nef specific CTL clones tended to be most inhibitory, followed by Gag, then by RT specific clones, regardless of avidity.
 - 3/14 CTL T-cell clones tested were specific for Gag/p17-SL9. Under conditions of excess peptide (100ug/ml), there was no difference in their lytic potential; all possessed similar effector capacity. Avidity was measured as the sensitizing dose of peptide required for 50% of maximal killing (SD50), which varied from 20 pg/ml to 100 ng/ml, over four orders of magnitude for all 14 epitopes. The SD50 range for Gag/p17-SL9 was 1,000 - 20,000 pg/ml.

- Keywords** acute infection, characterizing CD8+ T cell responses, immune dysfunction
- References** Lichterfeld *et al.* 2004a
- HIV-1 specific CD8+ T-cells in acute and long-term nonprogressive HIV-1 infection show strong ex-vivo proliferative capacities which are rapidly lost in chronic HIV-1 infection. The loss of CD8+ T-cell function is closely linked with the loss of HIV-1 specific, IL2 secreting CD4+ T-cells. The function can be rescued in vitro and in vivo by restoring the specific CD4+ T-cell help.
 - Despite being detectable at high frequencies, CD8+ T-cells specific for SL9 epitope were shown to entirely lose their proliferative capacity in chronic HIV-1 infection. This activity could be restored by co-stimulation with CD4+ T cells isolated from acute infection in an IL-2 dependent manner.

- References** Lopes *et al.* 2003
- CD8+ T cells from HIV-2 infected patients had more polyclonal TCR responses than HIV-1 infected patients, who tended to have oligoclonal responses. This results in limited plasticity of T cell responses to amino acid substitutions within epitopes in HIV-1 infections. HIV-2-specific CD8+ T-cells showed a more diverse TCR usage associated with enhanced CD8 expansion and IFN-gamma production on cross-recognition of variant epitopes.
 - Responses to this epitope were characterized in detail. One patient's response to SL9 A2-SLYNTVATL tetramers was shown to have only Vbeta5.1 clonotypes. The naturally occurring HIV-2 variant: sIFntvCVI, was not recognized well by this response or by the SLYNTVATL reactive CD8+ T cells in four additional A2+ HIV infected asymptomatic individuals. The subtype A variant, sIFntvatl was also poorly recognized, and 4/5 Ala substitutions abrogated responses. All variants bound to HLA-A2 with higher affinity than the index peptide except slyntAatl, which was slightly reduced, so the lack of cross-reactivity must have been due to the TCR.

References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0–80% as efficiently as the index peptide, and the relatively efficiency of the variant epitopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This epitope was one of six epitopes found to be under positive selection for escape mutations and was completely replaced by escape variants between days 327 and 635 (sLYntvatl and sLYnAvatl).

References Rowland-Jones *et al.* 1998b

- HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi – these CTL may confer protection.
- Seroprevalence in this cohort is 90–95% and their HIV-1 exposure is among the highest in the world.
- Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes.
- This epitope is conserved among B and D clade viruses.
- The Clade A version of the epitope, SLFNTVATL, was preferentially recognized by CTL.
- This epitope was recognized by two different exposed seronegative prostitutes.

Epitope SLYNTVATL
Epitope name LR23
Subtype B
Immunogen Vaccine
Vector/Type: peptide **Strain:** B clade LAI
Adjuvant: Incomplete Freund's Adjuvant (IFA), Montanide (ISA 720), P30, PLG
Species (MHC) mouse (A2.1)

Keywords binding affinity, vaccine-specific epitope characteristics, immunodominance

References Peter *et al.* 2001

- The stability of peptide binding to HLA-A2.1 was determined for six HLA-A2.1 peptides included in this vaccine study – ILKEPVHGV (RT), SLYNTVATL (p17), SLLNATDIAV (gp41) and LLWKGEHAV (RT) all bound with high affinity comparable to a influenza epitope reference (GILGFVFTL), while RGPGRFVFTI and VIYQYMDDL bound with a lower affinity (relative binding activity = 0.01).
- The four high-affinity peptides formed stable complexes with half-lives ranging between 8 and 32 hours, while the low affinity peptides had half lives of less than an hour.
- HLA-A2.1 transgenic mice were immunized with the six HIV-1 peptides and P30, as a universal T-helper epitope, with IFA or Montanide or microspheres as adjuvants.
- All peptides except VIYQYMDDL induced a strong CTL response in Cr-release assays - stronger responses were observed when peptides were delivered alone, indicating immunodominance when the combination was used.

Species (MHC) mouse (A2.1)

Keywords vaccine-specific epitope characteristics, immunodominance

References Peter *et al.* 2002

- When HIV-1 peptides were used to vaccinate HLA-A2.1 transgenic A2-Kb mice, strong responses to five peptides were observed when the peptides were given individually, but immunodominance limited the response to some of the peptides when they were given in combination Peter *et al.* [2001]. IL-12 can counteract immunodominance in BALB/c mice, so it was given with the multiple epitope vaccination, and was instead found to specifically eliminate the HLA-A2.1-epitope CTL responses, but not Kb CTL responses. This was possibly a consequence of transient depletion of T-cells, B cells and macrophages in the spleen.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cell responses

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Immunogen HIV-1 infection
Species (MHC) human (A11)
Keywords inter-clade comparisons
References Bond *et al.* 2001
- HLA-A11 CRF01 (called subtype E in Bond *et al.*) epitopes were identified that stimulated CTL from HIV+ female sex workers (FSW) from Northern Thailand, of whom more than half were HLA-A11 positive.

- 77 possible HLA-A11 epitopes were first defined using EpiMatrix, these were screened for binding to A11 finding and 26 bound, and 12 of these were epitopes for CTL responses from 8 HLA-A11 positive FSWs, six were novel, six were previously identified.
- This epitope was predicted by the EpiMatrix method to be likely to bind to A11, and it served as an epitope in the FSWs, it was one of the six A11 epitopes that had been previously defined.
- 3/8 tested FSWs recognized this epitope.
- This epitope was not conserved in other subtypes, and exact matches were uncommon.

- HXB2 Location** p17 (84–91)
Author Location Gag (83–90)
Epitope TLYCVHQR
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A*1101)
Keywords inter-clade comparisons, TCR usage
References Fukada *et al.* 2002

- Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A-E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals.
- TLYCVHQR was found to elicit clade-specific responses in clade B (TLYCVHQR is most common, and is also common in clade A – the variant tlycvhqK is common in clade B) and clade E (tIWcvhqr is most common). TLYCVHQR was not recognized by any CTL, tlycvhqK was recognized by CTL from 1/5 B clade infected Japanese subjects, and tIWcvhqr was not recognized by CTL from infected Thai subjects, so this seems to be a B clade exclusive epitope.
- The binding of the variant peptides to HLA A*1101 was comparable, but CTL that recognized tlycvhqK did not cross-recognize the other forms, implicating TCR interaction differences.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay
Keywords dynamics, acute infection, characterizing CD8+ T cell responses
References Jones *et al.* 2004
 - Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
 - The patient SUMA maintained low viral loads and stable CD4 T-cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
 - Only four epitopes were found to acquire escape mutations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

Epitope IEIKDTKEAL

Epitope name IL10

Subtype B

Immunogen Vaccine

Vector/Type: adeno-associated virus (AAV)

HIV component: gp120

Species (MHC) human (B60)

Assay type Chromium-release assay, Flow cytometric CTL assay

Keywords dynamics, immune evasion

References Brainard *et al.* 2004

- HIV-1 gp120 is shown to suppress the ability of antigen-specific CTLs to migrate or remain at sites of high viral replication by concentration-dependent chemotaxis and fugetaxis. Directional T-cell movement is shown to depend on the interaction of the V2 and V3 loops with the CXCR4 receptor. X4 HIV-1 gp120 causes the migration of T-cells, including HIV-1 specific CTL, away from infected target cells, another potential mechanism for immune evasion.

Epitope name Gag/p17-IL10

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B60)

Assay type Chromium-release assay

Keywords binding affinity, epitope processing, TCR usage, characterizing CD8+ T cell responses

References Yang *et al.* 2003b

- Killing efficiency of CTLs and their ability to suppress viral replication is shown to depend more on epitope specificity than to antigenic avidity. Different clones recognizing the same epitope had similar killing efficiency despite their variation in avidity. Nef specific CTL clones tended to be most inhibitory, followed by Gag, then by RT specific clones, regardless of avidity.
- 1/14 CTL T-cell clones tested were specific for Gag/p17-IL10. Under conditions of excess peptide (100ug/ml), there was no difference in their lytic potential; all possessed similar effector capacity. Avidity was measured as the sensitizing dose of peptide required for 50% of maximal killing (SD50), which varied from 20 pg/ml to 100 ng/ml, over four orders of magnitude for all 14 epitopes. The SD50 value for the Gag/p17-IL10 clone was 8,000 pg/ml.

Keywords dynamics, immunodominance, acute infection, kinetics, characterizing CD8+ T cell responses, reversion, viral fitness

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14

had changes that could have resulted in escape, and two were confirmed as escape.

- There was a weak response to this epitope during acute and early infection, and the epitope sequence did not vary during the first year of the infection.

Epitope NSSQVSQNY

Immunogen HIV-1 infection

Species (MHC) human (B*3501)

Keywords binding affinity

References Dorrell *et al.* 2001

- The crystal structure of this epitope bound to HLA-B*3501 shows that a serine can fit into the B pocket, which is shared between B35 and B53, with the hydroxyl group of the P2 serine occupying a position almost identical to the P2 proline that was previously considered the anchor motif.

- Novel B53 epitopes (DTINEEAAEW and QATQEVKNN) were defined in this study that showed that A and T can also serve as P2 anchor residues for the B pocket of HLA-B35 and B53 – while S, T, and P could all fit into the B pocket and form a hydrogen bond, A would not form a bond, so the authors propose compensatory interactions account for the high affinity of QATQEVKNN for B53.

Keywords dynamics, acute infection

References Wilson *et al.* 2000a

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWILGGLNK.
- The subject with A*0201 had a moderately strong response to SLNTVATL.
- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.
- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

HXB2 Location p24 (11–20)**Author Location** (C consensus)**Epitope** VHQAISPRTL**Subtype** C**Immunogen** HIV-1 infection**Species (MHC)** human (B*1510)**Country** South Africa.**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** characterizing CD8+ T cell responses**References** Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started

treatment during acute infection, 11 continuously treated and 11 with STL.

- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 29% of the study subjects, and it was the third most frequently recognized peptide.

Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human
Keywords HIV exposed persistently seronegative (HEPS)
References Kaul *et al.* 2001c

- This study examines CTL responses in HIV exposed, persistently seronegative individuals, HEPS, who eventually seroconverted – 11/114 HEPS Nairobi sex workers eventually seroconverted, and for six of these HIV CTL reactive epitopes had been defined while seronegative.
- The epidemiological factor associated with seroconversion was stopping sex work. HIV-specific CTL activity declined when HEPS sex workers stopped working for a period or retired.
- ISPRTLNAW was consistently recognized by 1/22 HEPS sex worker controls (ML1250), and LSPRTLNAW was recognized by 2 additional HEPS sex worker controls (ML1693 and ML1589).

HXB2 Location p24 (15–23)

Author Location
Epitope ISPRTLNAW

Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B*5701)
Keywords rate of progression, immunodominance
References Migueles & Connors 2001

- HLA B*5701 was found in a very high frequency in HIV-1 infected non-progressors, 11/13 (85%) versus 19/200 (9.5%) of progressors. Non-progressors tended to have an immune response that was highly focused on four p24 epitopes that were presented by B*5701, ISPRTLNAW, KAFSPEVIPMF, TSTLQEQIGW, and QASQEVKNW.

HXB2 Location p24 (15–23)
Author Location
Epitope ISPRTLNAW
Subtype B

Immunogen HIV-1 infection
Species (MHC) human (B*5701)
Keywords rate of progression, immunodominance
References Migueles & Connors 2001

- CTL activity was monitored in 27 individuals, including 10 LTNP with an over-expression of HLA B*5701 – these individuals have viral loads below the threshold of infection without therapy, and their immune response tends to be focused on peptides that contain B*5701 epitopes ISPRTLNAW, KAFSPEVIPMF, TSTLQEQIGW, and QASQEVKNW.
- CTL responses are broader in B*5701+ individuals with progressive viremia than those that control viremia.
- The HLA-A*0201 SLYNTVATL epitope response was not as strong in individuals that carried both A2, B57.

HXB2 Location p24 (15–23)

Epitope TLNAWVKVI

Immunogen HIV-1 infection, HIV-1 exposed seronegative

Species (MHC) human (A2)

Keywords inter-clade comparisons, HIV exposed persistently seronegative (HEPS)

References Kaul *et al.* 2001a

- Variants TLNAWVKV(I/V) are A/B clade specific.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.

HXB2 Location p24 (19–27)

Author Location p24 (A02, A30, B4402, B15)

Epitope TLNAWVKV

Immunogen HIV-1 exposed seronegative

Species (MHC) human (A2)

Assay type CD8 T-cell Elispot - IFN γ , Intracellular cytokine staining

Keywords HIV exposed persistently seronegative (HEPS), characterizing CD8+ T cell responses

References Missale *et al.* 2004

- HIV-specific T-cell response was tested in HIV-uninfected patients exposed to blood from a patient with highly replicating HIV; these same patients were nosocomially infected with HBV. HIV-specific T-cell responses were directed to structural and non-structural HIV proteins in two patients suggesting that the virus replicated in these patients sufficiently to prime a cell-mediated immune response that protected these individuals from HIV infection.
- This patient responded to 4/8 HIV epitopes tested in an IFN γ ELISPOT assay or tetramer assay. Responses were detected to this peptide 8 and 28 weeks after exposure with ELISPOT, but not by tetramer binding.

HXB2 Location p24 (19–27)

Author Location p24 (subtype B)

Epitope TLNAWVKV

Subtype B

Immunogen HIV-1 exposed seronegative

Species (MHC) human (A2, A*0202)

Keywords inter-clade comparisons

References Rowland-Jones *et al.* 1998b

- HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi – these CTL may confer protection.
- Seroprevalence in this cohort is 90–95% and their HIV-1 exposure is among the highest in the world.
- Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes.
- This epitope is conserved among A, B and D clade viruses.

Donor MHC A*2902, B*4403, B*0801

Country United States.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, immunodominance, acute infection, kinetics, characterizing CD8+ T cell responses, reversion, viral fitness

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.
- There was a weak response to this epitope during acute and early infection, and the epitope sequence did not vary during the first year of the infection.

HXB2 Location p24 (21–40)

Author Location p24 (153–172 SF2)

Epitope NAWVKVVEEKAFSPEVIMPF

Immunogen HIV-1 infection

Species (MHC) human

References Lieberman *et al.* 1997a

- Of 25 patients, most had CTL specific for more than 1 HIV-1 protein.
- Twelve subjects had CTL that could recognize vaccinia-expressed LAI gag.
- One of these 12 had CTL response to this peptide.
- The responding subject was HLA-A2, -B21.

HXB2 Location p24 (21–40)

Author Location p24 (153–172 SF2)

Epitope NAWVKVVEEKAFSPEVIMPF

Immunogen Vaccine

Vector/Type: virus-like particle (VLP) **HIV component:** CD4BS, Gag, gp120, V3

Species (MHC) macaque

References Wagner *et al.* 1998b

- A VLP is a non-infectious virus-like particle self-assembled from HIV Pr55 gag – macaques were immunized with VLPs bound to either gp120 or V3+CD4 linear domains Gag and Env specific CTL were stimulated in each case, and Ab response to gag and gp120 was elicited, but the gp120 neutralizing response occurred only with whole gp120, not V3+CD4 – despite the CTL and Ab response, immunized macaques were infected by intravenous challenge with SHIV chimeric challenge stock Wagner *et al.* [1998b]
- CTL specific for this epitope could be found both before and after SHIV challenge.

HXB2 Location p24 (21–40)

Immunogen HIV-1 infection

Species (MHC) human (B*1503)

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cell responses

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Epitope KAFSPEVIPMF

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B*5701)

Keywords rate of progression

References Goulder *et al.* 1996b

- This peptide was recognized by CTL from five slow progressors.
- Peptide defined on the basis of B*5801 binding motif, yet not cross-restricted except at high concentrations.
- This epitope is highly conserved.

HXB2 Location p24 (30–40)**Author Location** p24 (162–172 LAI)**Epitope** KAFSPEVIPMF**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B*5701)**Keywords** optimal epitope**References** Frahm *et al.* 2004

- C. Brander notes this is a B*5701 epitope.

HXB2 Location p24 (30–40)**Author Location****Epitope** KAFSPEVIPMF**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B*5701)**Keywords** rate of progression, immunodominance**References** Migueles & Connors 2001

- HLA B*5701 was found in a very high frequency in HIV-1 infected non-progressors, 11/13 (85%) versus 19/200 (9.5%) of progressors. Non-progressors tended to have an immune response that was highly focused on four p24 epitopes that were presented by B*5701, ISPRTLNAW, KAFSPEVIPMF, TSTLQEQIGW, and QASQEVKNW.
- Attempts to make all for HLA B*5701-epitope tetramers were made, but only the HLA B*5701-KAFSPEVIPMF tetramer folded properly. The percentage of CD8+ T cells staining with this HLA B*57 gag tetramer and the fraction of CD69+IFN- γ cells responding to autologous B cells pulsed with KAFSPEVIPMF was highly correlated ($r = 0.84$; $P = 0.005$). The percent of CD8+ T cells that stain with the A*2 gag SLYNTVATL tetramer was low (0–0.31%) in a A2+ B57+ LTNP, emphasizing the focus of the immune response on the B*5701 epitopes.

HXB2 Location p24 (30–40)**Author Location****Epitope** KAFSPEVIPMF**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B*5701)**Keywords** rate of progression, immunodominance**References** Migueles & Connors 2001

- CTL activity was monitored in 27 individuals, including 10 LTNP with an over-expression of HLA B*5701 – these individuals have viral loads below the threshold of infection without therapy, and their immune response tends to be focused on peptides that contain B*5701 epitopes ISPRTLNAW, KAFSPEVIPMF, TSTLQEQIGW, and QASQEVKNW.
- CTL responses are broader in B*5701+ individuals with progressive viremia than those that control viremia.
- The HLA-A*0201 SLYNTVATL epitope response was not as strong in individuals that carried both A2 and B57.

HXB2 Location p24 (30–40)**Author Location** Gag (162–172)**Epitope** KAFSPEVIPMF**Epitope name** KAF11**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B*5701)**Assay type** Intracellular cytokine staining, Flow cytometric CTL assay**Keywords** rate of progression, escape**References** Migueles *et al.* 2003

- cDNA Gag sequences from a set of 17 HLA-B*5701+ progressors and 10 LTNPs were obtained, and the variation in four p24 B*5701 epitopes examined. Sequence variants were more common ($p < 0.01$) in the epitopes in the progressors (median 3, range 1–7) than LTNPs (median 2, range 0–4).
- In general, use of the autologous protein in a target cell did not diminish the overall CD8+ T-cell responses.
- This epitope tends to be quantitatively immunodominant in B57+ people, including in some of the individuals in this study. It was extremely well conserved in the sequences obtained here, despite strong immune pressure, suggesting fitness constraints.

HXB2 Location p24 (30–40)**Author Location** p24 (30–40)**Epitope** KAFSPEVIPMF**Epitope name** KAFS**Subtype** A, B**Immunogen** HIV-1 infection**Species (MHC)** human (B*5701, B*5703)**Keywords** inter-clade comparisons, rate of progression**References** Gillespie *et al.* 2002

- CTL responses of eight HIV+ slow progressors from Nairobi Kenya or Oxford, UK who were B*5701 or B*5703 were studied, as B*57 is associated with slow progression.
- This epitope is located between the structurally conserved alpha-helix 1 and alpha-helix 2 (H1–H2) region of the p24 capsid protein, and tends to elicit strong reactions in B*57 individuals.
- Broad heterogeneous cross-clade reactivity to 6 clade variants of the KAFS peptide sequence were observed in one B*5701 and 5 B*5703 HLA-restricted patients, measured by IFN γ production Elispot assays as well as tetramer binding. The clade variants were: KAFSPEVIPMF (clades A and B), kGfNpevipmf (clades A/AC); kaLspevipmf (clade A); kafspevipVf (clade A); kafNpelipmf (group O); kafspeipmf (A/C); kafsQevipmf (A/C); and kaLspevipmf KNFSPEVIPMF A/G). Not all variants were well recognized in all patients, for example kafsQevipmf was not able to induce IFN gamma production in 3/6 tested, and had a diminished capacity to sensitize target cells for lysis.

Keywords acute infection, early-expressed proteins
References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15–92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- Alleles A3, B35, B57, and B62 were more frequently recognized than alleles A1, A2, A30, and A44 e.g., during primary infection. 2/10 patients, 1372 and 1397, recognized A2-restricted epitopes. The common A2-restricted epitopes Gag SL9 and Pol IV9 were not recognized in peptide tetramer-binding assays.

HXB2 Location p24 (30–40)
Author Location p24
Epitope KAFSPEVIPMF
Immunogen HIV-1 infection
Species (MHC) human (B57)
Assay type Intracellular cytokine staining
Keywords immunodominance, genital and mucosal immunity
References Kaul *et al.* 2003

- Predefined immunodominant peptide responses were used to compare CD8+ T-cell responses in the blood and cervix of 16 HIV+ Kenyan sex workers. Cervical responses were detected in 8/10 women from whom adequate samples could be obtained. The frequency of the CD8+ T-cell response in the genital tract was comparable to the blood, with a trend toward being slightly higher.
- The immunodominant response was to this epitope in the PBMC of 10/16 patients (Kaul *et al.* 2001, AIDS, 107:1303).

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B57)

Donor MHC A0201, A3, B57, C06, C07 and A01, A0201, B08, B57, C6, C7

Country United States.

Assay type cytokine production, Tetramer binding, Intracellular cytokine staining, Degranulation, CD107a and b cell surface mobilization

Keywords TCR usage

References Betts *et al.* 2004

- Both cytokine production and degranulation in HIV-1 specific and CMV specific CD8+ T-cells occurs at high peptide concentrations together with TCR downregulation. Only degranulation is observed at lower peptide concentrations with no observed TCR downregulation. Thus the nature of CTL response depends not on the specific T cell clonotype or antigen, but on the concentration of Ag presented on APCs.

Epitope KAFSPEVIPMF

Epitope name KF11

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B57)

Country United States.

Assay type CD8 T-cell Elispot - IFN γ

Keywords variant cross-recognition or cross-neutralization

References Draenert *et al.* 2004c

- CD8+ T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2–39) epitopic regions were targeted in an average of 6 proteins (range, 1–8). HAART resulted in decrease in antigen and reduction in gamma IFN Elispot responses, suggesting active responses to autologous virus. Limited or no mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.
- Two subjects recognized this epitope, one with high functional avidity, one with intermediate. Autologous sequence revealed no substitutions in this epitope compared to the B consensus.

Epitope KAFSPEVIPMF

Immunogen HIV-1 infection

Species (MHC) human (B57)

Country Netherlands.

Assay type CD8 T-cell Elispot - IFN γ

Keywords HIV exposed persistently seronegative (HEPS)

References Koning *et al.* 2004

- A high-risk seronegative group of 29 homosexual men showed reduced cellular in vitro susceptibility for HIV infection and enhanced production of RANTES compared to 15 men who went on to seroconvert. Significantly higher frequencies of HLA A*11, A*31 and Cw*15 were also found in the high risk seronegative men. Both groups of men had low frequencies of HIV-1 specific CD8+ T-cells, which may signify exposure more than protection from infection.
- 1/2 HLA B57+ infection-resistant men, compared to 0/1 pre-seroconversion men who went on to become infected, reacted to this epitope.

Epitope KAFSPEVIPMF
Subtype C
Immunogen HIV-1 infection
Species (MHC) human (B57)
Country South Africa.
Assay type CD8 T-cell Elispot - IFN γ
Keywords characterizing CD8+ T cell responses
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location p24 (30–40)

Epitope KAFSPEVIPMF
Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (B57, B58)
Keywords HIV exposed persistently seronegative (HEPS), immunodominance
References Kaul *et al.* 2001a

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B57/B58 women, 4/6 HEPS and 12/17 HIV-1 infected women recognized this epitope.
- The dominant response to this HLA allele was to this epitope in 2 of the 4/6 HEPS cases and in 7 of the 12/17 HIV-1 infected women.

Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Assay type T-cell Elispot
Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2–42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided, it appears to be HXB2.
- Responses to this peptide were detected in 22% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, immunodominance, escape, kinetics, characterizing CD8+ T cell responses, reversion, viral fitness

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.
- There was a weak response to this epitope during acute and early infection, and the epitope sequence did not vary during the first year of the infection.

References Montefiori *et al.* 2003

- HIV-1 + patient AC10 underwent early HAART treatment, which was discontinued 1.5 years later. At this timepoint potent NAb responses against autologous virus were detected. Treatment interruption initially induced weak CD8+ responses directed against 5 epitopes. By days 873d and 923d the CTL response had broadened to target 22 epitopes; of these six were fully characterized. Eventually the virus escaped the NAb response, but escape was not accompanied by a rise in viral load, and the authors suggest the virus was contained by the CTL response.

Assay type Chromium-release assay, CTL suppression of replication

Keywords escape

References Yang *et al.* 2003a

- Virus was cultured in the presence of CTL lines specific for 5 different epitopes (SLYNTVATL, ILKEPVHGV, IEIKDTKEAL, SEGATPQDL, and KEKGGLEGL) to study the emergence of escape mutations. Escape varied between clones for the same epitope, and between different epitopes. Gag and RT epitope escape, if it occurred at all, tended to be monoclonal and within the epitope, indicating strong fitness constraints, while the Nef epitope escape was rapid, polyclonal, and sometimes the result of upstream frameshifts.
- One CTL clone, 161Jx12, recognized this epitope, and apparently no resistance mutations were selected by this clone, although the data was not shown in the paper.

HXB2 Location p24 (44–52)

Author Location p24 (176–184)

Epitope SEGATPQDL

Epitope name Gag/p24-SL9

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B60)

Assay type Chromium-release assay

Keywords binding affinity, TCR usage, characterizing CD8+ T cell responses

References Yang *et al.* 2003b

- Killing efficiency of CTLs and their ability to suppress viral replication is shown to depend more on epitope specificity than to antigenic avidity. Different clones recognizing the same epitope had similar killing efficiency despite their variation in avidity. Nef specific CTL clones tended to be most inhibitory, followed by Gag, then by RT specific clones, regardless of avidity.
- 1/14 CTL T-cell clones tested were specific for Gag/p24-SL9. Under conditions of excess peptide (100ug/ml), there was no difference in their lytic potential; all possessed similar effector capacity. Avidity was measured as the sensitizing dose of peptide required for 50% of maximal killing (SD50), which varied

from 20 pg/ml to 100 ng/ml, over four orders of magnitude for all 14 epitopes. The SD50 value for Gag/p24-SL9 was 30 pg/ml, it was among the peptides with the highest avidity.

Author Location Gag
Epitope TPQDLNTML
Immunogen HIV-1 infection
Species (MHC) human
Assay type CD8 T-cell Elispot - IFN γ
Keywords assay standardization/improvement, epitope processing, characterizing CD8+ T cell responses
References Beattie *et al.* 2004

- This study compared CD8+ T-cell EliSpot responses to 58 Gag peptides that were optimal epitopes, with responses to overlapping 15 mers that spanned Gag. When screening for HIV-1-specific CD8+ T-cell responses from 49 HIV+ people, overlapping 15-mer peptide pools revealed several novel responses that would have been missed using predefined CD8 epitopes. However, the 15-mer pools often missed low-level responses to predefined epitopes, especially when the epitope was located centrally in the 15-mer peptide, and the overall level of response to the 15 mers was generally lower (mean 1.4 five fold dilutions lower, range 0-3).
- The response to TPQDLNTML was used as an example of a titration curve. When comparing the peptide TPQDLNTML to the 15 mer EGATPQDLNTMLNTV, the 15 mer had a diminished response to the same amount of peptide.

Country South Africa.
Assay type CD8 T-cell Elispot - IFN γ
Keywords cross-presentation by different HLA, characterizing CD8+ T cell responses
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

References Dorrell *et al.* 2001
- In clade A infected Gambians, three HLA-B53 epitopes were defined in Gag p24 using ELISPOT, tetramer, and cytotoxicity assays.
 - This optimal epitope was identified within the 20 mer reactive peptide that carried it by homology with a B53 epitope from HIV-2, a B subtype B7 peptide that corresponds to it, as B53 is part of the B7 superfamily, and by the proline in the anchor at position 2.
 - TPQDLNMML was recognized in 6/7 HLA-B53 subjects and was immunodominant in most subjects.
 - TPQDLNMML was A subtype-specific with no cross-recognition of the subtype B, C, and D variant, TPQDLNTML, although the B/C/D variant bound more efficiently to B53 – position 7 show great positional variation in crystal structures of two HLA-B53 complexes, suggesting variation here might significantly alter the position of the peptide in the binding groove and thus affect TCR interactions.
 - Only one subject might have had a cross-reactive response with the HIV-2 and Mamu-A*01 variant CTPYDINQML, and this subject might have been dual infected with HIV-2.

Epitope TPQDLNTML
Immunogen HIV-1 infection
Species (MHC) human (B7)
Keywords rate of progression, acute infection
References Day *et al.* 2001
- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)
 - 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.

- Subjects with chronic HIV-1 infection recognized between 2-8 out of 11 B7-restricted epitopes.
- An acute seroconverter homozygous for the B7 allele recognized five B7-restricted epitopes.
- The other acute seroconverter failed to recognize any of the 11 B7-restricted epitopes tested.
- The B7-restricted CTL response was highly variable and there was no clearly dominant epitope.

Keywords HAART, ART, supervised treatment interruptions (STI)

References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.

- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8+ T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient A displayed the greatest response to epitope B14-EL9(gp41), a strong response to B7-TL9(p24), and responses to B7-TM9(Nef) and A32-PW10(RT).

- The program Epimatrix was used in conjunction with the program Conservatrix to identify conserved regions of HIV that might serve as epitopes.
 - A subset of the potential epitopes was identified that could bind to the appropriate HLA-allele, and 15 predicted B7 superfamily (HLA B7, B8, and B58) epitopes were identified that could stimulate IFN γ production in an ELISPOT assay.
 - TPQDLNMMLN was newly defined as an HLA-B7 epitope in this study, although it was previously published as a B*8101 epitope.
 - TPQDLNMMLN was shown to stimulate an ELISPOT response, but could not be shown to bind to HLA-B7.
 - The variant TPQDLNTMLN was cross-reactive, had previously been identified as a HLA-B14 epitope, and could bind to HLA-B7.
- HXB2 Location** p24 (48–57)
Author Location Gag
Epitope TPQDLNMMLN
Epitope name 1309
Subtype multiple
Immunogen HIV-1 infection
Species (MHC) human (B7)
Donor MHC A03, A24, B07, B38, Cw07, Cw12/13
Country United States.
Assay type T-cell Elispot
Keywords binding affinity, computational epitope prediction
References De Groot *et al.* 2003
- Epitopes defined using sequence parsing and matching algorithm Conservatrix, and epitope prediction tool EpiMatrix, were shown to be conserved in a broad range of HIV-1 sequences derived from different parts of the world. 31 novel highly conserved HIV-1 epitopes were found, among which four were recognized as promiscuous epitopes and five as MHC supertypes.
 - Estimated binding probability for TPQDLNMMLN: 31%.

Epitope PQDLNTMLN
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B14, Cw8)
References Lubaki *et al.* 1997
- Eighty two HIV-1-specific CTL clones from 5 long-term non-progressors were isolated and analyzed for breadth of response.
 - A sustained Gag, Env and Nef response was observed, and clones were restricted by multiple HLA epitopes, indicating a polyclonal response.
 - Despite this being a well defined conserved epitope, none of the 11 gag-specific clones from a B-14 positive subject could recognize either it or p24 RAEQASQEV.
 - Christian Brander notes that B14 and Cw8 are in linkage disequilibrium, and that this epitope may be Cw8.
- HXB2 Location** p24 (51–59)
Author Location p24
Epitope DLNTMLNTV
Immunogen HIV-1 infection
Species (MHC) chimpanzee
References Santra *et al.* 1999
- 3/4 animals displayed HIV-1 Gag-specific CTL activity.
 - Effector cells from two chimpanzees were able to recognize two epitopes also recognized by human HIV-1 Gag-specific CTL (SPRTLNAWV, HLA-B7, and DLNTMLNTV, HLA-B14).

- No chimpanzee CTL were detected to the following human HIV-1 specific Gag epitopes, although they were embedded within 20mer peptides that contained a reactive epitope: ISPRTLNAW, HLA-B57; KRWIILGLNK, HLA-B27; and DRFYKTLRA, HLA-B14.

HXB2 Location p24 (51–59)

Author Location p24 (subtype A)

Epitope DLNMLNIV

Subtype A

Immunogen HIV-1 exposed seronegative

Species (MHC) human (B14)

References Kaul *et al.* 2000

- 11/16 heavily HIV exposed but persistently seronegative sex-workers in Nairobi had HIV-specific CD8 gamma-IFN responses in the cervix – systemic CD8+ T-cell responses tended to be to the same epitopes but at generally lower levels than cervical CD8+ T-cell responses.
- Low risk individuals did not have such CD8+ cells.
- CD8+ T-cell epitopes: DTVLEDINL (3 individuals), SLYNT-VATL (4 individuals), LSPRTLNAW (3 individuals) and YPLT-FGWCF (4 individuals) were most commonly recognized by the HIV-resistant women.

Author Location p24 (183–191 LAI)

Epitope DLNTMLNTV

Epitope name G5

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B14)

Keywords HAART, ART

References Mollet *et al.* 2000

- A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFNgamma production to measure responses.

- In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished.

- Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.

Author Location p24 (183–191)

Epitope DLNMLNIV

Immunogen HIV-1 infection, HIV-1 exposed seronegative

Species (MHC) human (B14)

Keywords HIV exposed persistently seronegative (HEPS), immunodominance

References Kaul *et al.* 2001a

- Variants DLNMLNIV/DLNTMLNVV are specific for clades A/B.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B14 women, 4/4 HEPS and 3/7 HIV-1 infected women recognized this epitope, likelihood ratio 4.8, p value 0.1, and HEPS women tended to respond to DLNMLNIV/DLNTMLNVV, while infected women tended to respond to DRF(F/W)KTLRA.
- The dominant response to this HLA allele was to this epitope for all 4/4 HEPS cases and in only one of the 3/7 HIV-1 infected women.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.
- Four epitopes were considered to be “resistant epitopes”, as they were preferentially reactive in HEPS women and so may confer resistance, and these were found in three different proteins: A2 ILK(D/E)PVHGV in RT, A*6802 DTVLEDINL in Protease, B14 DLN(M/T)LN(I/V)V in p24 and B18 FRDYV-DRF(Y/F)K also in p24.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cell responses

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Immunogen HIV-1 infection
Species (MHC) human
Assay type T-cell Elispot
Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003
 - Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
 - 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2–42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
 - A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
 - The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
 - Responses to this peptide were detected in 22% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Species (MHC) mouse (H-2K^d)

Keywords immunodominance

References Doe & Walker 1996

- Immunodominant murine CTL response to this peptide observed after immunization with vaccine VVgagpol.
- Optimal peptide was defined.

HXB2 Location p24 (65–73)

Author Location Gag (197–205)

Epitope AMQMLKETI

Immunogen Vaccine

Vector/Type: Listeria monocytogenes *HIV component:* Gag

Species (MHC) mouse (H-2K^d)

References Rayevskaya & Frankel 2001

- BALB/c mice were immunized with a highly attenuated recombinant Listeria monocytogenes, Lmdaldat, that can grow only when supplemented with D-alanine, and that expresses HIV-1 HXB2 Gag.

- Parenteral immunization provided protection against systemic and mucosal challenges with a recombinant vaccinia virus expressing HIV-1 gag, and a long lasting memory CTL response against Gag in spleen, mesenteric lymph nodes, and Peyer's patches directed against the gag protein.

- Oral immunization gave protection only against mucosal virus challenge and was associated with a transient CTL response in the three lymphoid tissues examined.

- L. monocytogenes is a gram-positive bacteria that enters the macrophage on phagocytosis and lives in the cytoplasm – secreted L. monocytogenes antigens are processed and presented by both class I and class II pathways.

HXB2 Location p24 (65–73)

Author Location Gag (197–205 SF2)

Epitope AMQMLKETI

Immunogen Vaccine

Vector/Type: Listeria monocytogenes
Strain: B clade HXB2 *HIV component:* Gag

Species (MHC) mouse (H-2K^d)

Keywords immunodominance

References Mata *et al.* 1998

- BALB/c mice were immunized with recombinant Listeria monocytogenes (Lm-Gag) expressing HIV-1 HXB2 Gag.
- L. monocytogenes is a gram-positive bacteria that enters the macrophage on phagocytosis and lives in the cytoplasm – secreted L. monocytogenes antigens are processed and presented by both class I and class II pathways.
- This is the immunodominant CTL epitope in Gag in BALB/c mice.
- AMQMLKETI does not contain established Kd anchoring residue in position 2, tyrosine or phenylalanine, thus deviating from the typical Kd anchoring motif – the lack of the aromatic anchor residue is compensated for by interaction of the glutamine at P3 with pocket D of Kd.

HXB2 Location p24 (65–73)

Author Location Gag (HXB2)

Epitope AMQMLKETI

Subtype B

Immunogen Vaccine

Vector/Type: vaccinia, vesicular stomatitis virus (VSV) *Strain:* B clade HXB2, B clade IIIB *HIV component:* Env, Gag

Species (MHC) mouse (H-2K^d)

Keywords immunodominance

References Haglund *et al.* 2002a

- Different HIV strains were used for different regions: Env IIIB, Gag HXB2.
- BALB/c mice were vaccinated with rec vesicular stomatitis virus (rVSV) expressing either HIV-1 Gag, Env, or both, and compared to using rec Env and Gag in vaccinia virus (rVVs). The primary response was determined by cell lysis, cytokine production and tetramer staining.
- Primary CTL responses to the immunodominant Gag (AMQMLKETI) epitope peaked in 7 days for GAG-rVSV, 3% of the cells were tetramer positive, and this response was 8-fold higher than for Gag-rVV.

- Vaccinating with GagEnv-rVSV carrying both Gag and Env allowed recognition of both HIV-1 proteins, but at reduced levels compared to either Gag-rVSV or Env-rVSV alone.
- Intranasal immunization with Env-rVSV yielded CTL responses that were strong but reduced compared to an intraperitoneal route.

HXB2 Location p24 (65–73)

Author Location Gag (HXB2)

Epitope AMQMLKETI

Subtype B

Immunogen Vaccine

Vector/Type: vaccinia, vesicular stomatitis virus (VSV) *Strain:* B clade HXB2, B clade IIIB *HIV component:* Env, Gag

Species (MHC) mouse (H-2K^d)

Keywords immunodominance

References Haglund *et al.* 2002b

- Different HIV strains were used for different regions: Env IIIB, Gag HXB2.
- BALB/c mice were vaccinated with rec vesicular stomatitis virus (rVSV) expressing either HIV-1 Gag or Env, or both, and retention of memory responses and recall responses were studied by tetramer staining and IFN-gamma production.
- Seven months after vaccination with Env-rVSV, 6% of the CD8+ cells were tetramer positive for the immunodominant Env epitope; these cells had a memory phenotype, CD44-Hi positive.
- Env in rec vaccinia virus (Env-rVV) elicited a strong recall response, with up to 45% to the CD8+ T-cell population tetramer positive and activated (expressing CD62L-Lo), and capable of IFN-gamma production.
- A prime with Env-rVSV and heterologous boost of Env-rVV gave remarkably high levels of memory cells, with approximately 1/3 of the CD8+ splenocytes being Env specific memory cells 150 days after the boost.
- A Gag-rVSV or EnvGag-rVSV prime and with a heterologous Gag-rVV or EnvGag-rVV boost combination gave 40% tetramer positive CD8+ cells, but the fraction of IFN-gamma producing cells was only about 25%. Still the heterologous vector prime-boost combination showed a profound benefit.
- A HIV-1 protein rVSV prime, rVV boost was a more potent combination than a vector reversal of a rVV prime and rVSV boost.

Epitope AMQMLKETI

Subtype B

Immunogen Vaccine

Vector/Type: vaccinia, Listeria monocytogenes *HIV component:* Gag, Nef

Species (MHC) mouse (H-2K^d)

Donor MHC H-2d

Assay type cytokine production, proliferation, Tetramer binding, Intracellular cytokine staining, Chromium-release assay

Keywords memory cells

References Rayevskaya *et al.* 2003

- Splenocytes derived from BALB/c mice immunized and boosted with Lmdd-gag were stimulated with gag-peptide specific antigen *in vitro*. In culture, CTL activity against this epitope reached a maximum at 9 days, then declined. Peptide restimulation gave a delayed (18 hours) but potent response, and growth was IL-2 or IL-15 dependent. Adoptive transfer of 5000 of the sorting purified cells could protect recipient BALB/c against vaccinia-gag challenge up to 3 months after transfer.

HXB2 Location p24 (65–73)

Author Location

Epitope AMQMLKETI

Epitope name A9I

Immunogen Vaccine

Vector/Type: DNA, virus-like particle (VLP), polypeptide *HIV component:* Gag, p24 Gag, V3

Species (MHC) mouse (H-2K^d)

Assay type cytokine production, Chromium-release assay

Keywords epitope processing, vaccine-specific epitope characteristics, immunodominance, vaccine antigen design

References Wild *et al.* 2004

- A codon optimized gag DNA vaccine was compared to a myristylation defective gag and p24 alone, both of which lack signals for secretion from transfected cells. Gag-derived immunogens that were secreted as VLPs and those that remained intracellular (p24) each produced strong CTL responses, and neither the size of antigen nor cellular trafficking and localization significantly influenced the strength of humoral and cellular immune activation. The formation and release of VLPs was not essential for eliciting strong CTL. BALB/c mice were given the DNA vaccine by i.m. administration of plasmid DNA for the prime and boost.

- Linking the region encoding the V3 immunodominant epitope to the gag gene did not diminish the response to the Gag p24 epitope A9I, but did enable a response to the V3 epitope.
- Minigenes were made incorporating just one epitope, minitopes, carrying one of three murine class I epitopes linked to the Ad2-E3 protein-derived signal peptide to allow access of the epitope to the ER. Weak induction of cellular immune responses was observed, in contrast to the complex polypeptide.

Assay type CD8 T-cell Elispot - IFN γ
Keywords characterizing CD8+ T cell responses
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ

Keywords cross-presentation by different HLA, characterizing CD8+ T cell responses

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location p24 (108–117)

Author Location p24 (233–252)

Epitope TSTLQEQIGW

Immunogen HIV-1 infection

Species (MHC) human (B57)

References Bernard *et al.* 1998

- This study focuses on six rare long-term survivor HIV-infected people who were infected for many years without exhibiting immune dysregulation – such immunologically normal HIV-infected (INHI) cases occur at a frequency between 0.1 and 1% in the infected population.
- No direct CTL were found in any of the six INHIs, but above background CTLp activity was found in 3/6 INHIs.
- Epitope sequences were deduced from larger reactive peptides based on HLA binding motifs – XSXXXXXXXXXW is a B57 binding motif, and CTL activity against TSTLQEQIGW has been found in two other B57 long-term non-progressors.

Epitope TSTLQEIAW

Epitope name TW10

Subtype B, C

Immunogen HIV-1 infection

Species (MHC) human (B57)

Keywords escape, reversion, viral fitness

References Leslie *et al.* 2004

- TSTLQEIAW (the consensus form in the C clade) responses dominate the immune response in HLA-B57 individuals, and this epitope is also recognized in HLA-B5801 individuals. TSnLQEIAW is shown to be an escape mutant correlated with HLA-B57 and HLA-B5801 alleles. The variant can be transmitted to HLA-B57/B5801 negative individuals, but reverts to wild-type in those. A second escape mutation within the epitope is, however, maintained after transmission; TSNLQEIQGW is the most common form of the epitope in the B clade, and a G substitution to some other amino acid, often A, was frequently noted in B57+ individuals; transmission of these variants persist in the new host.

Epitope TSTLQEQIGW

Epitope name TW10

Immunogen HIV-1 infection

Species (MHC) human (B57, B*5801)

Keywords review, rate of progression, immunodominance, escape, acute infection, reversion, viral fitness

References Goulder & Watkins 2004

- This paper is a review of the role of CTL in HIV infection, and it uses the TW10 epitope as an example. HLA B*57 and B*5801 both can present this epitope, and are associated with successful containment of HIV infection. The early response to TW10 is immunodominant, and often followed by rapid escape due to the T->N substitution, tsNlqeqigw. Some long term survivors do not carry the escape form, possibly because the CTL response to this epitope is able to suppress viremia. Others do carry the N escape form, and presumably control viremia due to viral attenuation; in support of this the N rapidly back mutates to T in a new host, so there is likely to be a high fitness cost. In contrast, the epitope sometimes contains a G->A substitution at position 9, and the A can persist in a new host after transmission.

Assay type CD8 T-cell Elispot - IFN γ

Keywords binding affinity, acute infection, early-expressed proteins, cross-presentation by different HLA

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- This epitope was recognized in three of the acutely infected individuals and was presented by both HLA-B57 and B58.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.

Species (MHC) human (B57, B58)

Country Gambia.

Assay type Intracellular cytokine staining

Keywords escape, TCR usage, variant cross-recognition or cross-neutralization, characterizing CD8+ T cell responses

References Lopes *et al.* 2003

- CD8+ T cells from HIV-2 infected patients had more polyclonal TCR responses than HIV-1 infected patients, who tended to have oligoclonal responses. This results in limited plasticity of T cell responses to amino acid substitutions within epitopes in HIV-1 infections. HIV-2-specific CD8+ T-cells showed a more

diverse TCR usage associated with enhanced CD8 expansion and IFN-gamma production on cross-recognition of variant epitopes.

- This peptide was recognized by a CD8+ T-cell clonotype with Vbeta5.1 usage in one HIV-1 infected patient, and all HIV-1 patients had narrow TCR usage, while HIV-2 patients used multiple TCR Vbeta chains. The HIV-2 variant of this peptide is: tstVEEqiQw. 5/6 HIV-2 infected individuals could recognize both the HIV-1 and HIV-2 peptides, while 0/5 HIV-1 infected patients that could react with the HIV-1 peptide could also react with the HIV-2 peptide.

Species (MHC) human

Assay type T-cell Elispot

Keywords supervised treatment interruptions (STI), immunodominance, early treatment

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2–42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 19% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Epitope NPPIPVGGEIYKRWIILGLNKIVRMYSPTSILD

Subtype B

Immunogen Vaccine

Vector/Type: lipopeptide

Species (MHC) human

References Gahery-Segard *et al.* 2000

- Anti-HIV lipopeptide vaccine consisting of six long amino acid peptides derived from Nef, Gag and Env HIV-1 proteins modified by a palmitoyl chain was administered in a phase I trial.
- A CD4+ T cell proliferative response to at least one of the six peptides was observed in 9/10 vaccinees – 9/10 reacted to this peptide.
- 9/12 tested mounted a CTL response to at least one of the six peptides; each of the six peptides elicited a CTL response in at least one individual – this peptide was particularly immunogenic, eliciting a CTL response in four vaccinees.
- All of the 12 tested had an IgG response to this peptide.

HXB2 Location p24 (121–152)

Author Location Gag

Epitope NPPIPVGGEIYKRWIILGLNKIVRMYSPSILD

Immunogen HIV-1 infection, Vaccine

Vector/Type: lipopeptide *HIV component:* Gag

Species (MHC) human (A*0201)

References Seth *et al.* 2000

- Immunization of 2/4 HIV seropositive HLA selected individuals with a 32 amino acid Gag lipopeptide that contains CTL epitopes restricted by HLA A33, B8, B27, B35, and Bw62 gave a transient increase in peptide-specific bulk CTL response, but they did not decrease plasma viral load.
- Placebo and HLA mis-matched controls showed no change in CTL.
- The responders carried HLA Bw62 and B35 – the two HLA-matched that did not respond carried B35 and B8.

Epitope PPIPVGGEIY

Subtype B

Immunogen HIV-1 exposed seronegative

Species (MHC) human (B35)

Keywords inter-clade comparisons

References Rowland-Jones *et al.* 1998b

- HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi – these CTL may confer protection.
- Seroprevalence in this cohort is 90-95% and their HIV-1 exposure is among the highest in the world.
- Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes.
- This epitope is conserved among B and D clade viruses.
- The Clade A version of the epitope, PPIPVGDIY, was preferentially recognized by CTL.

HXB2 Location p24 (122–130)

Author Location

Epitope PPIPVGDIY

Immunogen HIV-1 infection

Species (MHC) human (B35)

Keywords acute infection

References Wilson *et al.* 2000a

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers—high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWILGGLNK.
- The subject with A*0201 had a moderately strong response to SLYNTVATL.
- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.
- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGDIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

Epitope PPIPVGDIY

Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (B35)

Keywords HIV exposed persistently seronegative (HEPS), immunodominance

References Kaul *et al.* 2001a

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B35 women, 1/3 HEPS and 3/4 HIV-1 infected women recognized this epitope.
- The dominant response to this HLA allele was to this epitope in the 1/3 HEPS case and in the all 3/4 responsive HIV-1 infected women.
- Subject ML 857 shifted from a A*6802 DTVLEDINL and B35 (H/N)PDIVYQY response prior to seroconversion to a B35 PPIPVGDIY and B35 VPLRPMTY response post-seroconversion.

Immunogen HIV-1 infection, Vaccine

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade
HIV component: p17 Gag, p24 Gag

Species (MHC) human (B35)

Keywords inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected

to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].

- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ ELISPOT assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Epitope name GEI
Immunogen HIV-1 infection
Species (MHC) human (B8)

Keywords HAART, ART, supervised treatment interruptions (STI), immunodominance, escape, acute infection

- References** Oxenius *et al.* 2000
- Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable.
 - Six of the 7/8 study subjects that were HLA B8 recognized this epitope.
 - Patient SC2 (HLA A1, B7/8, Cw0701/0702, DR4/53, DQ7) had CTL responsiveness against epitopes FLKEKGGL, GPKVKQWPL, and GEIYKRWII peptides – FLKEKGGL tetramer staining steadily declined and at day 1340 the FLKEKGGL stained cells were no longer detected and the escape mutant FLKENGGI was found in 8/10 clones.
 - Patient SC9 (HLA A1/2, B8/13, Cw0/0701, DR2/11, DQ6/7) had a CTL response against epitopes FLKEKGGL, ILKEPVHGV, SQRQDILDWIYHTQGYFPDWQNY, and GEIYKRWII and all responses declined during therapy initiated at day 390 but were restored when therapy become intermittent.

- Patient SC19(HLA A11/12, B8/44, Cw06/0701, DR3/7, DR52/53, DQ 2/8) had a CTL response to epitopes FLKEKGGL, GEIYKRWII, ACQGVGGPGHK, AVDLSH-FLK, and FNCGGEFFY that declined during therapy initiated at day 197.
- Patient SC10(HLA A1/3, B8/35, DR1/8, DQ 4/5) had sustained therapy started during acute infection and maintained an immunodominant response to FLKEKGGL and a response to GEIYKRWII through day 1088.
- Patient SC12(HLA A1, B8/39, Cw0701/0702, DR2/3, DR51/52, DQ2/6) had sustained therapy started during acute infection and maintained an immunodominant response to FLKEKGGL throughout and minor responses to GEIYKRWII, DCKTILKAL, GGKKKYKLK – GEIYKRWII and GGKKKYKLK responses were stimulated by a brief period off therapy.
- Patient SC11(HLA A1, B8, Cw0201, DR3/11, DR52, DQ2/7) started therapy early, remained on therapy for 40 days, then reinitiated HAART at day 640 had a CTL response to FLKEKGGL, GPKVKQWPL, and GEIYKRWII throughout and received a benefit from the early limited course therapy.

HXB2 Location p24 (127–135)

Author Location p24 (259–267 SF2)

Epitope GEIYKRWII

Immunogen HIV-1 infection

Species (MHC) human (B8)

Keywords HAART, ART, acute infection

References Altfeld *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-B8+ individuals that had a CTL response to this epitope broken down by group: 2/3 group 1, 2/3 group 2, and 2/2 group 3.

HXB2 Location p24 (127–135)

Author Location p24

Epitope GEIYKRWII

Epitope name GEI

Immunogen HIV-1 infection

Species (MHC) human (B8)

Keywords HAART, ART, supervised treatment interruptions (STI)

References Oxenius *et al.* 2002b

- Using previously defined epitopes Oxenius *et al.* [2000, 2001a] in an IFN γ ELISPOT assay, 13 chronically HIV-1 infected patients were studied over a period including therapy with standard treatment interruptions (STI).

- STIs induced increased recognition of CTL epitopes, but there was no correlation between CTL responses with viral rebound rates, plateau viral loads, or clearance rates.

HXB2 Location p24 (127–135)

Author Location p24

Epitope GEIYKRWII

Subtype A, B, C, D

Immunogen HIV-1 infection, Vaccine

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade
HIV component: p17 Gag, p24 Gag

Species (MHC) human (B8)

Keywords inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ ELISPOT assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Epitope GEIYKRWII

Subtype B

Immunogen Vaccine

Vector/Type: lipopeptide *Strain:* B clade LAI *HIV component:* Env, Gag, Nef *Adjuvant:* QS21

Species (MHC) human (B8)

Assay type proliferation, CD8 T-cell ELISPOT - IFN γ , Chromium-release assay

Keywords vaccine-induced epitopes, variant cross-recognition or cross-neutralization

References Gahéry-Ségard *et al.* 2003

- After injection of an anti-HIV-1 lipopeptide vaccine and the booster injections, a response was observed in >85% of 28 volunteers, and a long-term immune response was observed in >50% of the volunteers. A positive effect of QS21 adjuvant was found for B- and CD4+T-cell responses. A higher number of CD8+ T-cell epitopes was induced after a fourth boost injection. This epitope was one of the most frequently recognized of the 31 epitopes that the vaccinated volunteers responded to.

Subtype C
Immunogen HIV-1 infection
Species (MHC) human (B*0801)
Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ
Keywords characterizing CD8+ T cell responses
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Author Location p24

Epitope EIYKRWII

Immunogen HIV-1 infection

Species (MHC) human (B8)

Keywords rate of progression

References Kostense *et al.* 2001

- HLA tetramers to six epitopes were used to study HLA-A2, B8 and B57 CTL in 54 patients – HIV-specific tetramer positive cells were inversely correlated with viral load in patients with high CD4, but in patients with CD4 T-cells below 400 high tetramer frequencies were found despite high viral load.
- Most patients have high levels of HIV-specific T-cell expansions, but many of these cells aren't functional.
- In 15 of the patients, the proportion of IFN gamma producing tetramer cells correlated with AIDS-free survival.
- 4/13 patients that reacted with EIYKRWII displayed epitope mutations in a minority of sequences, which did not correlate with disease progression or viral load – these mutations were: Patient 156 (KIYKRWMI), Patient 36 (EIYKRRII), Patient 656 (KIYKRWII, EIYERWMI), and Patient 159 (EIYKRWVI).
- Stimulation with HLA-B8 p24 and Nef epitopes significantly increased Nef-specific T-cell numbers in 2 patients (748 and 1113)
- There were more functional IFN-gamma producing Nef-specific T-cells within the T-cell population than there were active p24 Gag-specific T-cells.

Assay type CD8 T-cell Elispot - IFN γ

Keywords variant cross-recognition or cross-neutralization

References Draenert *et al.* 2004c

- CD8 T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2–39) epitopic regions were targeted in an average of 6 proteins (range, 1–8). HAART resulted in decrease in antigen and reduction in gamma IFN Elispot responses, suggesting active responses to autologous virus. Limited or no mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.
- Three subjects recognized this epitope, with intermediate functional avidity. Autologous sequence revealed one substitution, Diyrkwil, in one of the three; this version of the epitope also had intermediate functional avidity with the donor's cells.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, acute infection, characterizing CD8+ T cell responses

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape mutations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

Epitope KRWIILGGLNK

Immunogen HIV-1 infection

Species (MHC) human (B*2705)

Keywords dynamics, acute infection

References Wilson *et al.* 2000a

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load was also found.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
- Tetramers with peptide variants KRWIILGGLNK and KRWIIMGGLNK were used – CTL from most B27 donors recognize both variants, although one of the three subjects recognized only KRWIILGGLNK.
- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWIILGGLNK.
- The subject with A*0201 had a moderately strong response to SLYNTVATL.

- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMYTK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.
- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

Keywords inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

References Goulder *et al.* 2001b

- 85% of B27+ adults have CTL that recognize this epitope, but only 2/6 children did.
- Responses to this dominant B27-restricted Gag epitope are present during the time of decreasing viral load in acute infection.
- Three children who shared B27 with their mothers did not respond to this epitope and inherited escape mutations from their mothers.
- A transmitted R132T anchor residue mutation abrogated binding to B27.
- In the three children infected with the non-binding KK10 variants, the dominant CTL specificity was still HLA-B27-restricted, but it was directed against an epitope in p17, IRL-RPGGKK, only rarely recognized in adults when KRWIILGLNK is the dominant response.
- Mutations in this epitope were observed in autologous clones of subjects who were B27-positive with a higher frequency than those who were B27-negative ($P = 0.0005$)
- These mutations are being sexually transmitted in adult infections.

Keywords HAART, ART, supervised treatment interruptions (STI)
References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 symptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient C displayed the greatest response to B27-KK10(p24), and in decreasing order also responded to A24-RW8(Nef), B7-IL9(gp41), A24-RL9(gp41), A24-YL8(gp41), and B7-TM9(Nef). Patient D also displayed the greatest response to B27-KK10(p24), and also responded to A30-RY11(p17), A32-PW10(RT), A30-KY11(RT), A32-RW10(gp120), and B18-YY9(Nef).

References Feeney *et al.* 2004

- Viral load in a perinatally infected child remained low until emergence of an escape variant (kTwilglnk) in the immunodominant CTL epitope KRWIILGLNK when the child was 7.4 years old. The emergence of this escape mutation was followed by an increase in viremia and an increase in the number of targeted CTL epitopes, measured again when the child was 9.2 years old. The timing suggests that the loss of recognition of this epitope may have resulted in the subsequent loss of immune control.
- The mutation krwillMglnk has been suggested to be compensatory and required for the emergence of the previously described escape mutation kKwillMglnk (Kelleher 2001). The L136M mutation does appear in this child, but not in conjunction with the R132T escape mutation.

Assay type CD8 T-cell Elispot - IFN γ
Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2–42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, acute infection, characterizing CD8+ T cell responses

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.

- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape mutations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

Assay type CD8 T-cell Elispot - IFN γ

Keywords variant cross-recognition or cross-neutralization

References Draenert *et al.* 2004c

- CD8 T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2–39) epitopic regions were targeted in an average of 6 proteins (range, 1–8). HAART resulted in decrease in antigen and reduction in gamma IFN EliSpot responses, suggesting active responses to autologous virus. Limited or no mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.
- One subject recognized this epitope, with intermediate functional avidity. The autologous sequence matched the B consensus.

References Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.
- All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

Keywords optimal epitope

References Frahm *et al.* 2004

- C. Brander notes this is a B*5201 epitope.

HXB2 Location p24 (143–150)

Author Location p24 (273–283 IIIB)

Epitope RMYSPSTI

Epitope name SL9

Immunogen HIV-1 infection

Species (MHC) human (B52)

Keywords epitope processing, immunodominance, escape

References Brander *et al.* 1999

- Multiple natural variations in the SL9 flanking regions of the immunodominant epitope SLYNTVATL were tested and found not to adversely affect CTL recognition or prevent epitope processing, suggesting that viral escape from the HLA-A*0201-restricted CTL response against SLYNTVATL is probably not linked to variations in the flanking regions of this epitope.
- The CTL response to RMYSPSTI was used as a control.

HXB2 Location p24 (143–150)

Author Location p24 (273–283 IIIB)

Epitope RMYSPSTI

Immunogen HIV-1 infection

Species (MHC) human (B52)

Keywords responses in children, mother-to-infant transmission, escape

References Wilson *et al.* 1999a

- This study describes maternal CTL responses in the context of mother-to-infant transmission.
- Detection of CTL escape mutants in the mother was associated with transmission, but the CTL-susceptible forms of the virus tended to be found in infected infants.
- No variants of this epitope were found in a non-transmitting mother that had a CTL response to this epitope.

HXB2 Location p24 (143–150)

Author Location p24 (143–150)

Epitope RMYSPSTI

Immunogen HIV-1 infection

Species (MHC) human (B52)

References Ferrari *et al.* 2000

- One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.

HXB2 Location p24 (143–151)

Author Location Gag (275–283)

Epitope RMYSPSTIL

Subtype B

Immunogen Vaccine

Vector/Type: lipopeptide *Strain:* B clade

LAI HIV component: Env, Gag, Nef

Adjuvant: QS21

Species (MHC) human (A2)

Assay type proliferation, CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords vaccine-induced epitopes, variant cross-recognition or cross-neutralization

References Gahéry-Ségard *et al.* 2003

- After injection of an anti-HIV-1 lipopeptide vaccine and the booster injections, a response was observed in >85% of 28 volunteers, and a long-term immune response was observed in >50% of the volunteers. A positive effect of QS21 adjuvant was found for B- and CD4+T-cell responses. A higher number of CD8+ T-cell epitopes was induced after a fourth boost injection. This epitope was one of the 31 epitopes that the vaccinated volunteers responded to.

Epitope QGPKPFRDYVDRFYKTLRAEQA

Immunogen Vaccine

Vector/Type: peptide *HIV component:* p24 Gag

Species (MHC) mouse

References Nakamura *et al.* 1997

- Mice immunized with this synthetic peptide generated specific CTLs, a proliferative response, and antibodies.
- The amino acids shown in the epitope field were based on the numbering provided by Nakamura *et al.*, and may not be correct.
- The CTL epitope was shown to be located in positions 291–300.

HXB2 Location p24 (157–178)

Author Location p24 (290–309)

Epitope PKEPFRDYVDRFYKTLRAEQAS

Immunogen HIV-1 infection

Species (MHC) human (B14)

References Musey *et al.* 1997

- Cervical and peripheral blood derived CTL clones from an HIV-infected woman recognized this epitope.

HXB2 Location p24 (159–168)

Author Location Gag (291–300)

Epitope EPFRDYVDRF

Immunogen Vaccine

Vector/Type: DNA, DNA with protein boost
Strain: B clade LAI *HIV component:* Gag, Nef, Tat *Adjuvant:* IL-18

Species (MHC) mouse (H-2^d)

Keywords Th1

References Billaut-Mulot *et al.* 2001

- DNA vaccinated BALB/c mice primed and boosted with the multiepitopic vaccine with IL18 showed lymphoproliferative responses 7 weeks post immunization.
- Strong but non-lasting HIV-specific CTL responses were detected by a Cr-release assay and DNA prime/DNA boost was more effective than DNA prime protein boost.
- Immunization with either the multiepitopic DNA or with the mixed DNA vaccine induced HIV-1 specific Th1 cytokines (IL-2 and IFN- γ)
- Co-administration of IL18 increased T-cell responses but decreased anti-HIV antibody levels.

HXB2 Location p24 (159–168)

Author Location p24

Epitope EPFRDYVDRF

Epitope name E10F

Immunogen Vaccine

Vector/Type: DNA *HIV component:* Gag

Species (MHC) mouse (H-2^d)

Assay type Chromium-release assay

References Bojak *et al.* 2002b

- Codon-optimized gag gene DNA vaccines were compared to wild type by vaccination of BALB/c mice. Codon optimized DNA gave a Th1 polarized Th response, a strong antibody response that persisted from more than 20 weeks, and CTL responses, while wild-type DNA induced weak and inconsistent immune responses.

HXB2 Location p24 (159–168)

Author Location

Epitope EPFRDYVDRF

Epitope name E10F

Immunogen Vaccine

Vector/Type: DNA, virus-like particle (VLP), polypeptide *HIV component:* Gag, p24 Gag, V3

Species (MHC) mouse (H-2L^d)

Assay type cytokine production, Chromium-release assay

Keywords epitope processing, vaccine-specific epitope characteristics, immunodominance

References Wild *et al.* 2004

- A codon optimized gag DNA vaccine was compared to a myristylation defective gag and p24 alone, both of which lack signals for secretion from transfected cells. Gag-derived immunogens that were secreted as VLPs and those that remained intracellular (p24) each produced strong CTL responses, and

neither the size of antigen nor cellular trafficking and localization significantly influenced the strength of humoral and cellular immune activation. The formation and release of VLPs was not essential for eliciting strong CTL. BALB/c mice were given the DNA vaccine by i.m. administration of plasmid DNA for the prime and boost.

- Minigenes were made incorporating just one epitope, mini-topes, carrying one of three murine class I epitopes linked to the Ad2-E3 protein-derived signal peptide to allow access of the epitope to the ER. Weak induction of cellular immune responses was observed, in contrast to the complex polypeptide. The E10F minigene did not produce a detectable CTL response.

HXB2 Location p24 (159–178)

Author Location Gag (291–310)

Epitope EPFRDYVDRFFKTLRAEQAT

Subtype C

Immunogen HIV-1 infection

Species (MHC) human

Keywords inter-clade comparisons

References Novitsky *et al.* 2002

- HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein.
- Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses.
- This peptide was among the 8 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.

HXB2 Location p24 (159–178)

Author Location Gag (96ZM651.8)

Epitope EPFRDYVDRFFKTLRAEQAT

Immunogen

Species (MHC) human (B*44031)

Keywords inter-clade comparisons, immunodominance

References Novitsky *et al.* 2001

- This study provides a survey of CTL responses and full length HIV-1 genome sequences from a C subtype infected Botswanan cohort.
- 16 of 46 (34.8%) had CTL responses to one or more peptides within the second immunodominant region of Gag (peptides SILDIKQGPKPEFRDYVDRF, EPFRDYVDRFFKTLRAEQAT, and FKTLRAEQATQEVKNWMTDT) with ELISPOT results median and range 500 (100 to 1,250) SFC/10⁶ PBMC
- 3 of 6 (50%) carriers of HLA-B*44031 showed CTL responses to the peptide EPFRDYVDRFFKTLRAEQAT.

HXB2 Location p24 (160–169)

Author Location p24

Epitope PFRDYVDRFF

Epitope name PF-10

Subtype C

Immunogen HIV-1 infection

Species (MHC) human

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ , CD4 T-cell Elispot - IFN γ , Intracellular cytokine staining, Chromium-release assay

Keywords inter-clade comparisons, epitope processing, immunodominance, cross-presentation by different HLA

References Masemola *et al.* 2004b

- Highly targeted regions in Gag for CD8+ T-cells were defined for individuals with C clade infections in South Africa. Nine specific epitopes within the most reactive regions were characterized. This is one of five novel epitopes that were found among subtype C HIV-1 from African patients that hadn't previously been identified in B clade infections. Some epitopes were shown to be promiscuous, presented by multiple class I restricting alleles. The HLA restricting element for this optimal epitope was not determined due to limited material.

HXB2 Location p24 (161–169)

Author Location (C consensus)

Epitope FRDYVDRFF

Subtype C

Immunogen HIV-1 infection

Species (MHC) human (Cw*1801)

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cell responses

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (B18)
Keywords HIV exposed persistently seronegative (HEPS)
References Kaul *et al.* 2001a
 - Variants FRDYVDRF(Y/F)K are specific for the B,D/A,C clades.
 - ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
 - Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
 - 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
 - Among HLA-B18 women, 3/4 HEPS and 1/9 HIV-1 infected women recognized this epitope, likelihood ratio 5.3, p value 0.04, and HEPS women tended to respond to FRDYV-DRFY/FK, while infected women tended to respond to YPLT-FGWCY/F.
 - The dominant response to this HLA allele was to this epitope for all 3/4 HEPS cases and for the single HIV-1 infected women that responded to this epitope.

- Four epitopes were considered to be “resistant epitopes”, as they were preferentially reactive in HEPS women and so may confer resistance, and these were found in three different proteins: A2 ILK(D/E)PVHGV in RT, A*6802 DTVLEDINL in Protease, B14 DLNM/TLN(I/V)V in p24 and B18 FRDYV-DRF(Y/F)K also in p24.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.

HXB2 Location p24 (161–170)

Author Location p24

Epitope FRDYVDRFYK

Subtype B, D

Immunogen HIV-1 infection, Vaccine

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade
HIV component: p17 Gag, p24 Gag

Species (MHC) human, macaque (B18)

Keywords inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

HXB2 Location p24 (161–174)

Author Location p24 (161–174 HXB2)

Epitope FRDYVDRFYKTLRA

Subtype B

Immunogen HIV-1 infection

Species (MHC) human

Assay type T-cell Elispot

Keywords supervised treatment interruptions (STI), immunodominance, early treatment

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.

- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Assay type CD8 T-cell ELISPOT - IFN γ

Keywords variant cross-recognition or cross-neutralization

References Draenert *et al.* 2004c

- CD8 T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2–39) epitopic regions were targeted in an average of 6 proteins (range, 1–8). HAART resulted in decrease in antigen and reduction in gamma IFN ELISPOT responses, suggesting active responses to autologous virus. Limited or no mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection pressure, yet the ELISPOT assays show robust responses, suggesting to the authors that gamma IFN based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.
- One subject recognized this epitope, with low functional avidity. The autologous sequence matched the B consensus.

Assay type CD8 T-cell ELISPOT - IFN γ , Chromium-release assay

Keywords dynamics, acute infection, characterizing CD8+ T cell responses

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape mutations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

References Hossain *et al.* 2003
- HLA-A*3303 is a common HLA allele in east and southeast Asia. Pol, Gag and Nef SF2 proteins were scanned for potential A*3303 epitopes. 99 potential epitopes were synthesized, and 52/99 bound to A*3303. Six of these served as peptide-targets for lysis by PBMC from infected individual, and clones derived from 4 of these 6 could lyse HIV-vaccinia infected target cells, indicating proper processing.
 - This epitope is one of the 2/6 peptides that could induce CTL responses in the PBMC of infected individuals, but was not properly processed in a vaccinia-HIV infected target cell.

Immunogen HIV-1 infection

Species (MHC) human

Assay type T-cell Elispot

Keywords supervised treatment interruptions (STI), immunodominance, early treatment

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2–42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 19% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Assay type CD8 T-cell Elispot - IFN γ

Keywords acute infection, early-expressed proteins

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- This epitope was recognized in two subjects early in infection, presented by B14 in each case.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Epitope name Gag/p24-DA9

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B14)

Assay type Chromium-release assay

Keywords binding affinity, TCR usage, characterizing CD8+ T cell responses

References Yang *et al.* 2003b

- Killing efficiency of CTLs and their ability to suppress viral replication is shown to depend more on epitope specificity than to antigenic avidity. Different clones recognizing the same epitope had similar killing efficiency despite their variation in avidity. Nef specific CTL clones tended to be most inhibitory, followed by Gag, then by RT specific clones, regardless of avidity.
- 1/14 CTL T-cell clones tested were specific for Gag/p24-DA9. Under conditions of excess peptide (100ug/ml), there was no difference in their lytic potential; all possessed similar effector capacity. Avidity was measured as the sensitizing dose of peptide required for 50% of maximal killing (SD50), which varied from 20 pg/ml to 100 ng/ml, over four orders of magnitude for all 14 epitopes. The SD50 value for Gag/p24-DA9 was 100,000 pg/ml, it had the lowest avidity of the 14 tested.

Donor MHC A28, A29, B14, B44, Cw8; A25, A32, B08, B14, Cw7, Cw8; A03, B14, B60, Cw3, Cw7

Country United States.

Assay type cytokine production, Intracellular cytokine staining, Chromium-release assay, Flow cytometric CTL assay

Keywords assay standardization/improvement, memory cells, characterizing CD8+ T cell responses

References Lichterfeld *et al.* 2004c

- Using a flow-cytometric cytotoxicity assay based on caspase-3 activation in dying target cells, it was shown that the subset of HIV-1-specific CD8+ T-cells secreting both IFN-gamma and TNF-alpha exhibit stronger cytotoxic activity than those secreting only IFN-gamma. These cells also exhibited stronger intracellular perforin expression. No association between HIV-1-specific CD8+ T-cell maturation phenotypes and intracellular perforin expression was found.
- 3/9 individuals recognized this epitope, presented by HLA-B14.

HXB2 Location p24 (166–174)

Author Location p24 (subtype B)

Epitope DRFYKTLRA

Subtype B

Immunogen HIV-1 exposed seronegative

Species (MHC) human (B14, B*1402)

Keywords inter-clade comparisons

References Rowland-Jones *et al.* 1998b

- HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi – these CTL may confer protection.
- Seroprevalence in this cohort is 90-95% and their HIV-1 exposure is among the highest in the world.

- Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes.
- This epitope is conserved among B and D clade viruses.
- The Clade A version of the epitope, DRFFKLTRA, was preferentially recognized by CTL.
- This epitope was recognized by two different exposed and uninfected prostitutes.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, immunodominance, acute infection, characterizing CD8+ T cell responses, reversion, viral fitness

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient BORI had high viral loads and rapid CD4 decline. BORI mounted 8 detected responses. BORI did not control viral replication well, and escape mutations occurred early and in most epitopes, 6/7 that were precisely identified.
- DRFYKTLRAEQ didn't vary. There was no response in acute infection to this epitope, but the response was detectable by early infection.

HXB2 Location p24 (169–185)

Author Location p24 (169–184 HXB2)

Epitope YKTLRAEQASQDVKNWN

Subtype B

Immunogen HIV-1 infection

Species (MHC) human

Assay type T-cell Elispot

Keywords supervised treatment interruptions (STI), immunodominance, early treatment

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2–42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- Responses to this peptide were detected in 17% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Keywords HAART, ART, supervised treatment interruptions (STI)

References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient B displayed the greatest response to epitope B44-AW11(p24) and also responded to A32-PW10(RT) in both PB and LN samples, while a third response against epitope A32-RW10(gp120) was only detected in the LN sample.

Assay type CD8 T-cell Elispot - IFN γ

Keywords variant cross-recognition or cross-neutralization

References Draenert *et al.* 2004c

- CD8 T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2–39) epitopic regions were targeted in an average of 6 proteins (range, 1–8). HAART resulted in decrease in antigen and reduction in gamma IFN EliSpot responses, suggesting active responses to autologous virus. Limited or no mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.
- One subject recognized this epitope, with low functional avidity. The autologous sequence matched the B consensus.

References Beattie *et al.* 2004

- This study compared CD8+ T cell EliSpot responses to 58 Gag peptides that were optimal epitopes, with responses to overlapping 15 mers that spanned Gag. When screening for HIV-1-specific CD8 T-cell responses from 49 HIV+ people, overlapping 15-mer peptide pools revealed several novel responses that would have been missed using predefined CD8 epitopes. However, the 15-mer pools often missed low-level responses to predefined epitopes, especially when the epitope was located centrally in the 15-mer peptide, and the overall level of response to the 15 mers was generally lower (mean 1.4 fivefold dilutions lower, range 0–3).
- In one individual, a response to QASQEVKNW could be detected at a concentration of 0.2 μ g/ml, while a response to RAEQASQEVKNWMT required 25 μ g/ml for detection.

Author Location

Epitope QASQEVKNW

Subtype B**Immunogen** HIV-1 infection**Species (MHC)** human (B*5701)**Keywords** rate of progression, immunodominance**References** Migueles & Connors 2001

- CTL activity was monitored in 27 individuals, including 10 LTNP with an over-expression of HLA B*5701 – these individuals have viral loads below the threshold of infection without therapy, and their CD8+ T-cell response tends to be focused on peptides that contain B*5701 epitopes ISPRTLNAW, KAF-SPEVIPMF, TSTLQEIQIGW, or QASQEVKNW.
- CTL responses are broader in B*5701+ individuals with progressive viremia than those that control viremia.
- The HLA-A*0201 SLYNTVATL epitope response was not as strong in individuals that carried both A2, B57.

HXB2 Location p24 (176–184)**Author Location** Gag (308–316)**Epitope** QASQEVKNW**Epitope name** QW9**Subtype B****Immunogen** HIV-1 infection**Species (MHC)** human (B*5701)**Assay type** Intracellular cytokine staining, Flow cytometric CTL assay**Keywords** rate of progression, escape**References** Migueles *et al.* 2003

- cDNA Gag sequences from a set of 17 HLA-B*5701+ progressors and 10 LTNPs were obtained, and the variation in four p24 B*5701 epitopes examined. Sequence variants were more common ($p < 0.01$) in the epitopes in the progressors (median 3, range 1–7) than LTNPs (median 2, range 0–4).
- In general use of the autologous protein in a target cell did not diminish the overall CD8+ T-cell responses.
- The substitution E312D (qasqDvknw) was common in progressors (8/17) and rare in LTNP (1/8) ($p = 0.06$). qasqDvknw and qasqEvknw peptides were made; this mutation does not affect binding to B*57. 2/4 progressors that carried only the D variant could not recognize the D variant peptide, but could recognize the E variant peptide, demonstrating immune escape.

HXB2 Location p24 (176–184)**Author Location** (C consensus)**Epitope** QATQDVKNW**Subtype C****Immunogen** HIV-1 infection**Species (MHC)** human (B*5801)**Country** South Africa.**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** characterizing CD8+ T cell responses**References** Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.

- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location p24 (176–184)**Author Location** p24 (308–316 LAI)**Epitope** QASQEVKNW**Subtype B****Immunogen** HIV-1 infection**Species (MHC)** human (B53)**References** Buseyne *et al.* 1997

- Minimal sequence determined through epitope mapping.
- This is a relatively conserved epitope.
- HLA-Cw*0401 was defined as the restricting element, but cells that carry Cw*0401 varied in their ability to present this epitope – this could be the result of diminished cell-surface expression of Cw*0401 in some cells.
- The HLA presenting molecule for this epitope was originally described as Cw*0401, but subsequent experiments with an HLA B53+ C4- cell line and with C1R cells transfected with HLA-B53 have shown that the HLA restricting element is HLA-B53 (F. Buseyne, pers. comm. 2000)

HXB2 Location p24 (176–184)**Author Location** (LAI)**Epitope** QASQEVKNW**Subtype B****Immunogen****Species (MHC)** human (B53)**Keywords** optimal epitope**References** Buseyne 1999; Frahm *et al.* 2004**HXB2 Location** p24 (176–184)**Author Location** p24 (NL43)**Epitope** QASQEVKNW**Epitope name** QW9**Immunogen** in vitro stimulation or selection**Species (MHC)** human (B53)**Keywords** epitope processing, dendritic cells**References** Buseyne *et al.* 2001

- Exogenous presentation or cross-presentation of epitopes by antigen presenting cells (APC) without protein synthesis is an alternative pathway for CTL epitope processing that may be important in the initial generation of viral specific CTL.
- Dendritic cells treated with AZT to inhibit protein synthesis were able to elicit a strong specific CTL response in QASQEVKNW specific CTL clone 141 without protein synthesis, while macrophages demonstrated a decreased presentation efficiency.
- Exogenous Gag epitope presentation was Env-dependent and required receptor-dependent fusion.

Keywords HIV exposed persistently seronegative (HEPS)

References Kaul *et al.* 2001a

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B53 women, 1/2 HEPS and 7/9 HIV-1 infected women recognized this epitope.

HXB2 Location p24 (176–184)

Author Location p24 (308–316 subtype A consensus)

Epitope QATQEVKNM

Subtype A

Immunogen HIV-1 infection

Species (MHC) human (B53)

Keywords binding affinity, inter-clade comparisons

References Dorrell *et al.* 2001

- In clade A infected Gambians, three HLA-B53 epitopes were defined in Gag p24 using ELISPOT, tetramer, and cytotoxicity assays.
- Two of the new epitopes lacked the predicted P2 anchors, DTI-NEEAAEW and QATQEVKNM, and bound to B53 with high affinity, thus extending the anchor residue motif for B53 and the related B35.
- While S, T, and P could all fit into the HLA-B35 or HLA-B53 B pocket and form a hydrogen bond, A would not form a bond, so the authors propose compensatory interactions account for the high affinity of QATQEVKNM for B53.
- QATQEVKNM was recognized in 6/7 HLA-B53 subjects.
- Cross-recognition of QATQEVKNM was not studied here, but it was noted that both the A, QATQEVKNM, and B, QASQDVKNW, subtype version of this epitope, are also presented by HLA-B57 and B58, common HLA alleles in Africans.

Country United States.

Assay type CD8 T-cell Elispot - IFN γ

Keywords variant cross-recognition or cross-neutralization

References Draenert *et al.* 2004c

- CD8 T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2–39) epitopic regions were targeted in an average of 6 proteins (range, 1–8). HAART resulted in decrease in antigen and reduction in gamma IFN EliSpot responses, suggesting active responses to autologous virus. Limited or no mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.
- Two subjects recognized this epitope, with high functional avidity. Autologous sequence revealed no substitutions in this epitope compared to the B consensus.

HXB2 Location p24 (176–184)

Author Location Gag (SF2)

Epitope QASQEVKNW

Epitope name QW9

Immunogen HIV-1 infection

Species (MHC) human (B57)

Keywords acute infection

References Goulder *et al.* 2001a

- This peptide elicited a weak CTL response during acute infection of patient PI004.
- Three CTL responses, to epitopes TSTLQEIQIW, ISPRTLNAW, and KAFSPEVIPMF, were evident early after infection; CTL responses to SLYNTVATL, QASQEVKNW, E1YKRWII, and FLKEKGGL were detectable at 5 months post-infection and beyond.

HXB2 Location p24 (176–184)

Assay type CD8 T-cell Elispot - IFN γ , CD4 T-cell Elispot - IFN γ
Keywords rate of progression, escape
References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0–80% as efficiently as the index peptide, and the relatively efficiency of the variant epitopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This was one of 8 reactive epitopes found not to vary over time.

HXB2 Location p24 (195–202)

Subtype C

Immunogen HIV-1 infection

Species (MHC) human

Keywords inter-clade comparisons

References Novitsky *et al.* 2002

- HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein.
- Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses.
- This peptide was among the 28 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.

HXB2 Location p24 (203–211)

Author Location Gag (335–343 SUMA)

Epitope KALGPAATL

Epitope name Gag KL9

Subtype B

Immunogen HIV-1 infection

Species (MHC) human

Donor MHC A*1103, A*2402, B*1402, B*1501, C*0802

Country United States.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, acute infection, characterizing CD8+ T cell responses

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape mutations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

Epitope ACQGVGGPGHK

Subtype B, CRF01_AE

Immunogen HIV-1 infection

Species (MHC) human (A*1101)

Keywords inter-clade comparisons, TCR usage

References Fukada *et al.* 2002

- Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A-E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals.
- ACQGVGGPGHK was found to elicit clade-specific responses in clade B (ACQGVGGPGHK is most common in clades A and B) and clade E (acqvggpgShk is most common and is also common in clades C and D). ACQGVGGPGHK was recognized by CTL from 4/5 B clade infected Japanese subjects, and acqvggpgShk from 3/7 E clade infected Thai subjects.
- The binding of the two variants to HLA A*1101 was almost identical, but bulk CTL generated from individuals did not cross-react with the cross-clade peptides, indicating the lack of cross-reactivity was due to TCR specificity.

Epitope ACQGVGGPGHK

Epitope name ACQ

Immunogen HIV-1 infection

Species (MHC) human (A11)

Donor MHC A11/12, B8/44, Cw06/0701, DR3/7, DR52/53, DQ2/8; A2/11, B8/44, Cw06/0701, DR3/7, DR52/53, DQ2

Keywords HAART, ART, supervised treatment interruptions (STI), immunodominance, acute infection

References Oxenius *et al.* 2000

- Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable.
- Both of the 2/8 HLA-A11 study subjects recognized this CTL epitope.

- Patient SC19(HLA A11/12, B8/44, Cw06/0701, DR3/7, DR52/53, DQ 2/8) had a CTL response to epitopes FLKEKGGL, GEIYKRWII, ACQGVGGPGHK, AVDLSH-FLK, and FNCGGEFFY that declined during therapy initiated at day 197.

- Patient SC18(HLA A2/11, B8/44, Cw06/0701, DR3/7, DR52/53, DQ2) recognizes the epitopes ACQGVGGPGHK, QVPLRPMTYK, AVDLSHFLK, and one called QIY but not fully described – he had brief therapy upon seroconversion and has had low viral load during 600 days of follow up.

Keywords characterizing CD8+ T cell responses
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

References Arnedo-Valero *et al.* 2004

- T cell immune responses following STI were monitored in two chronically HIV-1 infected partners (A and B) who had contracted HIV-1 during 1992. STI induced strong transitory CD4+ and CD8+ T cell responses in both patients. The viruses remained very closely related over 10 years, despite the two individuals having different HLA types; the authors suggest the maintained similarity does not support a strong role for HLA driven HIV diversity as has been claimed in Moore *et al.* (Science 2002).
- During the second treatment stop, patient A developed a strong proliferative response to p24, and multiple strong CD8+ T cell responses to Env, Pol, Gag and Nef. This patient was able to control viral load for two years follow up without therapy. Patient B developed a very weak CD4+ T cell response against p24 during breaks in therapy, and had CD8+ responses to two epitopes. Patient A: A01, A32, B*1410, B15; Patient B: A*3101, A68, B*4403, B51.

- T cell immune responses following STI were monitored in two chronically HIV-1 infected partners (A and B) who had contracted HIV-1 during 1992. STI induced strong transitory CD4+ and CD8+ T cell responses in both patients. The viruses remained very closely related over 10 years, despite the two individuals having different HLA types; the authors suggest the maintained similarity does not support a strong role for

HLA driven HIV diversity as has been claimed in Moore *et al.* (Science 2002).

- During the second treatment stop, patient A developed a strong proliferative response to p24, and multiple strong CD8+ T cell responses to Env, Pol, Gag and Nef. This patient was able to control viral load for two years follow up without therapy. Patient B developed a very weak CD4+ T cell response against p24 during breaks in therapy, and had CD8+ responses to two epitopes. Patient A: A01, A32, B*1410, B15; Patient B: A*3101, A68, B*4403, B51.

Epitope GPGHKARVLA

Epitope name 1291

Subtype multiple

Immunogen HIV-1 infection

Species (MHC) human (B7)

Donor MHC A03, A24, B07, B38, Cw07, Cw12/13; A01, A03, B07, B08, Cw03, Cw07

Country United States.

Assay type T-cell Elispot

Keywords binding affinity, computational epitope prediction

References De Groot *et al.* 2003

- Epitopes defined using sequence parsing and matching algorithm Conservatrix, and epitope prediction tool EpiMatrix, were shown to be conserved in a broad range of HIV-1 sequences derived from different parts of the world. 31 novel highly conserved HIV-1 epitopes were found, among which four were recognized as promiscuous epitopes and five as MHC supertypes.
- Estimated binding probability for GPGHKARVLA: 28%

HXB2 Location p24-p2p7p1p6 (225–8)

Author Location Gag (357–372 LAI)

Epitope GHKARVLAELTSLQVN

Subtype B

Immunogen HIV-1 infection

Species (MHC) human

References Buseyne *et al.* 1993a

- Vertical transmission of HIV ranges from 13% to 39%.
- Primary assays showed that cytotoxic activity against at least one HIV protein was detected in 70% of infected children.
- Epitopes recognized in five children were mapped using synthetic peptides and secondary cultures.
- Patient EM28 (CDC P2A) had a CTL response to four epitopes in Gag.

HXB2 Location p24-p2p7p1p6 (230–7)

Author Location Gag (386–)

Epitope VLAEAMSQV

Epitope name Gag-386

Immunogen

Species (MHC) human (A*0201)

Keywords binding affinity, inter-clade comparisons, supertype, computational epitope prediction, immunodominance

References Altfeld *et al.* 2001c

- HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested.
- Three additional previously described HLA-A2 epitopes were added to the set of 20, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2)
- VLAEAMSQV binds to all five HLA-A2 supertype alleles tested: A*0201, A*0202, A*0203, A*0206 and A*6802 (highest affinity)
- 4/22 individuals with chronic HIV-1 infection recognized this epitope, and it was immunodominant in 3/4 by ELISPOT.
- 0/12 acutely infected individuals recognized this epitope.

HXB2 Location p24-p2p7p1p6 (230–7)

Author Location Gag

Epitope VLAEAMSQV

Epitope name Gag 386

Subtype M

Immunogen Vaccine, in vitro stimulation or selection, computer prediction

Vector/Type: DNA, peptide **Adjuvant:** Incomplete Freund's Adjuvant (IFA)

Species (MHC) human, mouse, humanized mouse (A*0201)

Assay type cytokine production, T-cell Elispot

Keywords inter-clade comparisons, computational epitope prediction, escape, TCR usage, variant cross-recognition or cross-neutralization

References McKinney *et al.* 2004

- This study examined variant recognition of epitopes presented by A*0201 and A*1101. Numerous amino acid substitutions can be introduced into epitopes without disrupting their recognition by CTLs, although epitopes with multiple substitutions were less recognized. An algorithm was constructed for prediction of epitopes capable of inducing responses to a great number of variant epitopes.

- A total of 20 variant forms of Gag 386 were identified. More than 95% of the variant epitopes were recognized by CTLs from mice immunized with the parental form.
- Gag 386 epitope (parent or variant form) was present in 97% of HIV sequences of many M group subtypes.

HXB2 Location p24-p2p7p1p6 (230–7)

Epitope VLAEAMSQV

Epitope name Gag-VV9

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A2)

References Sabbaj *et al.* 2002b

- Among HIV+ individuals who carried HLA A02, 3/29 (10%) recognized this epitope.

HXB2 Location p24-p2p7p1p6 (230–7)

Author Location Gag (362–)

Epitope VLAEAMSQV

Epitope name Gag362(9L)

Immunogen HIV-1 infection, Vaccine

Vector/Type: peptide **Adjuvant:** Incomplete Freund's Adjuvant (IFA)

Species (MHC) human, transgenic mouse (A2)

Assay type T-cell Elispot, Chromium-release assay, Flow cytometric CTL assay

Keywords binding affinity, inter-clade comparisons, computational epitope prediction

References Corbet *et al.* 2003

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This peptide was a good A2 binder that induced CTL and CD8+ T-cell IFN gamma responses in mice. Responses were detected in 1/17 HIV+ HLA-A2 subjects.
- The variant vlaeamsqA was also immunogenic in A2 transgenic mice, eliciting a CD8+ T-cell response, as was recognized in 3/17 HIV+ people, including the person that recognized the vlaeamsqV variant.

HXB2 Location p24-p2p7p1p6 (230–7)

Author Location Gag (397–405)

Epitope VLAEAMSQV

Immunogen HIV-1 infection

Species (MHC) human (A2 supertype)

Keywords supertype, rate of progression

References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNP.

- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNP to clear virus.
- This epitope can bind all five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802)

Assay type proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric CTL assay

Keywords HAART, ART, supervised treatment interruptions (STI), immune dysfunction

References Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load.

- Less than 2 of 19 patients recognized this epitope.

HXB2 Location p2p7p1p6 (63–71)

Author Location p15 (63–71)

Epitope CTERQANFL

Immunogen HIV-1 infection

Species (MHC) human (B61)

Donor MHC A*0201, A11, B51, B61, Cw2, Cw14

Assay type CD8 T-cell Elispot - IFN γ

Keywords binding affinity, acute infection, early-expressed proteins

References Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15–92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN- γ secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.

- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

Assay type T-cell Elispot

Keywords supervised treatment interruptions (STI), immunodominance, early treatment

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started

treatment during acute infection, 11 continuously treated and 11 with STI.

- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2–42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Species (MHC) chimpanzee

References Kim *et al.* 1998

- The study explores the use of co-stimulatory molecules co-expressed with an HIV-1 immunogen in a DNA vaccine to enhance the immune response – co-expression of CD86, but not CD80, dramatically increased both HIV Env and Gag/Pol specific CTL and Th proliferative responses.

HXB2 Location Gag**Author Location** Gag (BRU)**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** rate of progression**References** Aladdin *et al.* 1999

- *In vitro* measurements of CTL-activity by Cr release assay in bulk culture showed no correlation between CTL-activity (gp120, Gag, Pol and Nef) and disease progression as measured by viral load, CD4 and time to death.

HXB2 Location Gag**Author Location** p24 (C consensus)**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** inter-clade comparisons, immunodominance**References** Goulder *et al.* 2000a

- The CTL-dominant response was focused on this epitope in a HIV+ South African – this epitope did not fall within the five most recognized peptides in the study.
- Three peptides GSEELRSLYNTVATL (p17 residues 71-85), SALSEGATPQDLNTMLNTVG (p24 41-60), and WEKIRL-RPGGKKKYKLK (p17 16-30) contained the dominant Gag-specific epitope in 31 out of 44 B-clade infected individuals from Boston who showed Gag-CTL responses.
- Five peptides RLRPGGKKHYMIKHLVW (p17 20-36), ELRSLYNTVATLYCV (p17Gag 74-88), SALSEGATPQDLNTMLNTVG (p24 41-60), FRDYVDRFFKTLRAEQA (p24 161-177), and SILDIKQGKEPFRDY (p24 149-164) contained dominant Gag-specific epitopes in 32 out of 37 C-clade infected subjects from South Africa.

HXB2 Location Gag**Author Location** Gag**Epitope****Immunogen** Vaccine**Vector/Type:** DNA **Strain:** ZF1 **HIV component:** complete genome**Species (MHC)** macaque**References** Akahata *et al.* 2000

- Rhesus macaques were vaccinated by i.m. injection with naked plasmid DNA carrying an HIV-1 complete genome vaccine, strain ZF1, with a mutated zinc finger in the nucleocapsid to prevent packaging.
- Env and Gag specific CTL but no antibody responses were induced in 2/4 vaccinated monkeys (MM145 and MM153)
- 2/4 monkeys (MM146 and MM143) produced antibodies against p24 and/or gp160, but no CTL response was detected.
- PBMC from all vaccinated monkeys produced IFN-gamma, in response to HIV-1 gp160, indicating a Th response – this response was 5 times higher in MM145, the animal with the strongest CTL response.

- 4 weeks post-challenge with SHIV NM-3rN plasma viral loads of both MM145 and MM153 (with a homologous Env) decreased to near or below the detection limit.
- 6-8 weeks post-challenge with SHIV NM-3rN plasma viral loads of both MM146 and MM143 decreased near or below the detection limit.

HXB2 Location Gag**Author Location** Gag**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** rate of progression**References** Salerno-Goncalves *et al.* 2000

- A general test of CD8 anti-viral activity was developed based on proviral load of coculture of autologous CD8+ cells with CD4+ cells after homogeneous superinfection with NSI virus.
- Significantly decreased the CD4+ T-cell proviral loads were found in 12 HIV+ slow progressors relative to 10 rapid progressors.
- Significant CD8+ mediated cytotoxicity directed against autologous cells infected with vaccinia carrying the HIV-1 gag gene was observed in slow progressors in contrast to rapid progressors, but no correlation was found between plasma viral load in 22/22 asymptomatic HIV infected individuals.

HXB2 Location Gag**Author Location** Gag**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**References** Young *et al.* 2001

- Addition of recombinant rec human IL12 (rhIL12) to cultures increased HIV-specific lysis of HIV-Gag, Pol and gp120 vaccinia expressed antigens (11/15 tested increased lysis by > 5%) if the culture was derived from HIV+ individuals who had CD4 cells/ul > 500.
- 2/10 individuals with <200 CD4 cells/ul, and 3/10 individuals with 200-500 CD4cells/ul, had an increase of >5% upon treatment of the culture with rhIL12, so a few individuals in late stage disease had CD8 cells that maintained responsiveness to rhIL12.

HXB2 Location Gag**Author Location** p24**Epitope****Immunogen** HIV-1 infection**Species (MHC)** mouse**References** de Quiros *et al.* 2000

- CB-17 SCID-Hu mice engrafted with peripheral blood mononuclear cells of four long-term nonprogressors (viral load < 50 copies/ml) displayed resistance to challenge with HIV-1 SF162, mediated by CD8+ T-cells and associated with proliferation in response to p24 – these patients did not have a higher level of HIV-1 specific immunity *in vitro*, so the mechanism is unknown.

HXB2 Location Gag**Author Location** Gag (subtype A, B, D)**Epitope**

Subtype A, B, D
Immunogen HIV-1 infection
Species (MHC) human
Keywords inter-clade comparisons
References Cao *et al.* 2000

- HIV-1 subtypes A and D dominate the Ugandan epidemic, and a vaccine trial using B clade antigen is underway – this study addresses relative levels of cross-reactive CTL responses in HIV infected Ugandans to A, D, and B clade recombinant vaccinia viruses expressing Gag, Env, RT or Nef from HIV-1 clades A, B, and D.
- Proteins corresponding to the subtype of the infecting strains tended to trigger higher levels of CTL response measured by percent specific lysis, but there was extensive inter-subtype cross-reactivity with B clade proteins and the co-circulating subtype.

Keywords review, HIV exposed persistently seronegative (HEPS)

References Rowland-Jones *et al.* 2001

- This is a review that summarizes observations about HIV-specific CTL found in the HIV-1 exposed persistently seronegative (HEPS) population.
- The CTL responses assayed by ELISPOT and by CTL precursor frequencies by limiting dilution analysis indicate that CTL in HEPS individuals tend to be of a lower magnitude than in chronic HIV-1 infections – the responses in HEPS cases are below the level of detection by tetramer assays.
- CD8+ CTL responses tend to be detectable in HEPS subjects only if they are recently exposed, and the response diminishes if exposure is reduced – it is not clear if there is a stable memory population in HEPS cases.
- CD8+ CTL responses in the HEPS population are associated with HIV-1 specific CD4+ T cell responses, assayed by proliferation assays, IL-2 secretion, and ELISPOT, and the authors consider the possibility that HIV-1-specific T-help responses improve the "quality" of the CD8+ response in HEPS individuals relative to HIV-1 infected individuals, who tend to have a poor HIV-1-specific T-help response.
- HIV-1 specific CD8+ CTL responses in HIV-1 infected individuals show reduced levels of perforin, and the T cells may not mature properly, and although similar studies have not been conducted in HEPS individuals this is considered as a possible difference in the CTL immune response in HEPS and HIV-1 infected people.

HXB2 Location Gag
Author Location
Epitope
Subtype B
Immunogen Vaccine
Vector/Type: DNA **HIV component:** Env, Gag, Pol
Species (MHC) mouse
Keywords review, vaccine-specific epitope characteristics
References Nabel 2002

- Using DNA that had humanized codon usage, CTL responses to DNA vaccines containing either Gag, Pol, Gag-Pol fusion protein, or Gag-Pol pseudoparticles suggested that the greatest breadth and most potent response was to the Gag-Pol fusion protein. The Gag-Pol fusion lacks the Gag precursor protein required for viral assemble, so does not form releaseable particles; the author speculates that longer retention of the Gag-Pol protein within the cell may enhance antigen presentation.

References Edwards *et al.* 2002

- 96% (26/27) chronically infected HIV-1 infected patients elicited gamma-IFN CD8+ T-cell responses against Gag.
- Nef and/or Pol CTL responses were detected in 86% of the subjects.
- The magnitude and breadth of Gag and p24 T-cell responses correlated with absolute CD4 counts, and inversely correlated with viral load.
- Pol and Int CTL responses correlated positively with absolute CD4+ T-cell count.
- Nef and Env responses did not correlate with either CD4 counts or viral load.

HXB2 Location Gag**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART, dendritic cells**References** Larsson *et al.* 2002b

- Autologous mature dendritic cells with rec vaccinia expressing Gag, Pol, Nef and Env could amplify CD8+ T-cell Elispot responses 4-38 fold in five HIV+ patients on successful HAART treatment, relative to autologous monocytes. Some weak responses could only be detected using mature dendritic cells as APCs, and this approach could be useful for detection of low frequency memory cells.

HXB2 Location Gag**Author Location** (IIIB)**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** immunotherapy**References** Trickett *et al.* 2002

- Conditions were optimized for ex-vivo expansion of CD8+ and CD4+ T-cells with the goal of functional T-cell production for autologous immunotherapy. 10,000-fold expansions were obtained in 14 days with optimized concentrations of IL-2, anti-CD3 and anti-CD28 coated microspheres, and decreasing amounts of serum over the first 8 days.

HXB2 Location Gag**Author Location** (IIIB)**Epitope****Subtype** B**Immunogen** HIV-1 and HCV co-infection**Species (MHC)** human**Keywords** rate of progression**References** Lauer *et al.* 2002

- HIV-1 and HCV immune responses were studied in 22 individuals who were co-infected with HIV-1 and hepatitis C virus (HCV). IFN γ production was measured in an Elispot assay of CD8+ T-cells using targets expressing either Gag, RT, Env and Nef in a vaccinia construct, or one of seven HCV proteins.
- All 22 patients targeted at least one protein. 20/22 patients recognized RT, 17/22 patients recognized Gag, 13/22 subjects recognized Env and 11/22 patients recognized Nef. Robust CTL activity was independent of disease progression or viral load.
- Despite high HCV viral loads, very few HCV CD8+ T-cell Elispot responses were detected. In a control HCV infected person who did not have HIV-1, strong anti-HCV responses were mounted.
- HIV-specific CD4 proliferative responses were detected in 9/17 coinfecting patients, but no HCV responses were detected.

HXB2 Location Gag**Author Location****Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** responses in children**References** Luzuriaga *et al.* 1995

- 2/3 infants infected in utero had detectable HIV-1 Gag and Env specific CTL responses, one by 4 months, one by 11 months of age. Levels of the responses varied at different time point. Pol responses were not detected.
- 2/4 infants infected intrapartum had detectable responses, one note until 11 months, one not until 42 months.
- HIV-specific CTL were not detected in ten HIV- infants that were born to HIV+ mothers.

HXB2 Location Gag**Author Location****Epitope****Immunogen** Vaccine**Vector/Type:** canarypox prime with gp120**boost Strain:** B clade LAI, B clade MN**HIV component:** Env, Gag**Species (MHC)** human**References** Gupta *et al.* 2002

- Different HIV strains were used for different regions: Gag, LAI; gp120, MN; and gp41, LAI
- A safety and immunogenicity study of a vaccine dosing schedule was studied in a trial conducted in high and low risk study subjects. There was a 76% cumulative probability of detecting a Gag or Env CTL response by day 728.

HXB2 Location Gag**Author Location****Epitope****Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART, responses in children**References** Scott *et al.* 2001

- CTL responses before and after initiation of ART were studied in 13 HIV-1 vertically infected infants <6 months of age, and 4 that were >6 months of age.
- Before ART 2/13 infants <6 months of age showed IFN γ Elispot CD8+ T-cell responses, one to Nef and one to Env and Nef, and these responses became undetectable after successful therapy—3 infants were coinfecting with CMV and all 3 had CMV-specific CD8+ T-cell responses.
- One older infant, at 23 months, had CTL responses against all for proteins tested, Gag, Pol, Nef and Env, and had the lowest plasma viremia of the study group. 3/4 infants older than 6 months of age responded to either Nef or Pol.
- Administration of ART over 48 weeks broadened the HIV-1-specific CTL response in 2/4 of the older children that were incomplete responders.

HXB2 Location Gag**Author Location** (IIIB, MN)**Epitope****Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** dendritic cells**References** Larsson *et al.* 2002a

- Dendritic cells acquire and present HIV-1 antigens derived from dead, apoptotic cells or from non-infectious, fusion-competent HIV-1 virions, and these DC cells could stimulate CD4+ and CD8+ T-cells resulting in IFN γ production in an Elispot assay. Both HLA Class I and class II molecules were used for presentation. This may be an important aspect of the initial immune response to HIV-1 infection of CD4+ cells in the mucosal subepithelia.

HXB2 Location Gag

References Amicosante *et al.* 2002

- A new assay was developed to detect CTL responses to HIV using 28 pooled 15-mer peptides from conserved regions in Gag that were selected to be rich in HLA class I motifs, carrying potential epitopes for more than 90% of HLA class I haplotypes, and to be conserved between subtypes. Some peptide variants were included, expanding the potential for cross-clade recognition. 12 Caucasians, even those on successful HAART, had detectable CTL responses using this assay, and as did five

Africans. People with either B subtype or A-G recombinant infections all reacted.

- The Gag peptide ICS assay was more sensitive to picking up CTL reactivity than whole Gag in HAART treated people. Initiation of STI increased the number of IFN- γ producing CD8+ T-cells detected using the peptide assay.

HXB2 Location Gag

Author Location Gag

Epitope

Immunogen Vaccine

Vector/Type: vaccinia *HIV component:* Gag

Adjuvant: block copolymer CRL8623

Species (MHC) macaque

Assay type CD8 T-cell Elispot - IFN γ

Keywords vaccine-induced epitopes

References Caulfield *et al.* 2002

- Codon-optimized HIV Gag DNA vaccines were given i.m. with or without a nonionic block copolymer(CRL8623) as adjuvant. DNA-CRL8623 formulations induced 2-fold higher Elispot responses, shifting the response towards CD8+ T-cells.
- 23 monkeys recognized 25 different epitopes with an average of 2.7 epitopes per monkey, and a minimum of 1 and a maximum of 5 peptides per monkey.
- Responses were detected up to 18 months after vaccination.

HXB2 Location Gag

Author Location Gag

Epitope

Subtype multiple

Immunogen

Species (MHC) human

Assay type Flow cytometric CTL assay

Keywords inter-clade comparisons

References Currier *et al.* 2003

- CD8-cellular immune responses from 21 HIV-1 infected patients from Kenya infected with subtype A, C, D, and unique recombinants were studied for cross-recognition of Gag, Env, and Nef vaccinia-expressed proteins representing subtypes A-H, including CRF01.
- Both subtype-specific and cross-reactive CTL were observed, with a skewing of responses towards the infecting subtype in the nine subjects with full length sequence available. The magnitude of the responses to Gag were the highest, less to Nef, and still less to Env.
- For Gag, 8/21 subjects responded to at least 7/8 different subtype proteins, 7 had a mixed response, recognizing some subtypes but not others, and 6 responded to only one or none of the different subtype proteins. For Env, 4/19 subjects responded to at least 7/8 subtypes, 8 had a mixed response, and 7 responded to one or none. For Nef, 5/19 subjects responded to at least 7/8 subtypes, 8 had a mixed response, and 6 responded to one or none.

HXB2 Location Gag

Author Location Gag (SF2)

Epitope

Subtype B

Immunogen Vaccine

Vector/Type: DNA, protein, virus-like particle (VLP), PLG microparticle *Strain:* B clade SF2 *HIV component:* Gag *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72), LTK63

Species (MHC) macaque

Assay type proliferation, Chromium-release assay

References Otten *et al.* 2003

- Immunization strategies for Gag (p55) in macaques were compared. GAG DNA prime with a boost of Gag adsorbed onto PLG (polyactide coglycolide) microparticles with LTK63 as adjuvant gave the strongest CD4+ T cell proliferative, CTL, and antibody responses, compared with Gag protein, or Gag virus-like particles (VLP). GAG DNA was best for inducing CTL responses, Gag-PLG for T-help and antibody; the prime-boost combination gave strong responses for all three.

HXB2 Location Gag

Author Location Gag

Epitope

Subtype C

Immunogen HIV-1 infection

Species (MHC) human

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ

Keywords rate of progression, immunodominance, acute infection, early-expressed proteins

References Masemola *et al.* 2004a

- Anti-HIV T-cell responses in subtype C HIV-1 infected individuals in the beginning of the infection target multiple protein regions, but the responses are dominated by Nef, making up almost one-third of the total responses; the second most targeted protein was p24. A correlation between Gag specific responses and plasma viral load was also found.
- Neither breadth nor magnitude of CD8+ T-cell responses were correlated with control of virus, however hierarchical preferential targeting of Gag was significantly associated with lower viral loads.

HXB2 Location Gag

Author Location Gag

Epitope

Subtype A

Immunogen Vaccine

Vector/Type: DNA, modified vaccinia Ankara (MVA), polyepitope, DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17/p24 Gag

Species (MHC) human

Country United Kingdom.

Assay type CD8 T-cell Elispot - IFN γ

Keywords epitope processing, vaccine-induced epitopes, vaccine antigen design

References Mwau *et al.* 2004

- Phase I clinical trial in healthy uninfected individuals was conducted evaluating the immunogenicities of candidate DNA- and MVA-vectored HIV vaccines. Both DNA and MVA vaccines alone and combined (DNA prime-MVA boost) were shown to be safe and induce HIV-specific responses in 78%, 88% and

89% of individuals, respectively. Responses in some individuals could be detected 1 year after vaccination.

- The vaccine in this case was a clade A p17/p24 antigen linked to a polyepitope string of A clade epitopes. Responses were tested with peptide pools, and multiple strong responses to the gag proteins and to the polyepitope region were observed. MVA alone did as well as a DNA prime, MVA boost in this study, although the study included small numbers.

HXB2 Location Gag

Author Location Gag

Epitope

Subtype B

Immunogen Vaccine

Vector/Type: non-replicating adenovirus

Strain: B clade *HIV component:* Gag

Species (MHC) mouse

Assay type Intracellular cytokine staining

Keywords Th1, Th2

References Pinto *et al.* 2003

- Heterologous prime boosts with replication-defective adenoviral vectors of different simian serotypes expressing the same transgene product of HIV-1 were shown to be highly efficient in increasing specific CD8+ T-cell responses.

HXB2 Location Gag

Author Location

Epitope

Immunogen computer prediction

Species (MHC) (A*0201, B*3501)

Keywords inter-clade comparisons, computational epitope prediction

References Schönbach *et al.* 2002

- Computational methods (artificial neural networks, hidden Markov models, binding matrices based on HLA association rates) were used to identify HLA-A*0201 and HLA-B*3501 HIV T-cell epitope candidates from 533 Gag, Env and Pol sequences of which 374 were derived from HIV-1, 97 were derived from HIV-2 and 62 from SIV. Comparisons to known epitopes and between clades were made.

HXB2 Location Gag

Author Location Gag

Epitope

Immunogen HIV-1 infection

Species (MHC) human (A*0201, Cw*08)

References Shacklett *et al.* 2000

- HIV-1 specific, MHC class I-restricted CTL killing was detected in duodenal and rectal gut associated lymphoid tissue (GALT) sites from three infected individuals – the distribution of class I restricted CTL was different in the peripheral blood samples and GALT samples.

HXB2 Location Gag

Author Location Gag

Epitope

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B*35)

Keywords rate of progression

References Jin *et al.* 2002

- Patients with HLA-B*35 variants B*3502, B*3503, B*3504, and B*5301 tend to proceed to AIDS more quickly than those with B*3501.
- Of 32 patients with HLA-B*35 alleles CD8+ CTL responses were quantified using an intracellular cytokine staining assay – 75% had responses to Pol, 69% to Gag, 50% to Nef, and 41% to Env.
- The overall magnitude of CTL responses did not differ between those bearing B*3501 and the others. A higher percentage of Gag responses was observed in those that had lower RNA levels that carried B*3501, and there was a negative association with viral load and CTL activity. The data is consistent with higher levels of CTL responses contributing to protection in B*3501 individuals, but not in B*3502, B*3503, B*3504, and B*5301 individuals.

HXB2 Location Gag**Author Location****Epitope****Subtype** A, B, C**Immunogen** Vaccine

Vector/Type: canarypox prime with gp120 boost, canarypox prime with gp160 boost
Strain: B clade LAI, B clade MN, B clade SF2
HIV component: Gag, gp120, gp41, Nef, Pol

Species (MHC) human (B60)

Keywords inter-clade comparisons, vaccine-specific epitope characteristics

References Ferrari *et al.* 2001

- Different HIV strains were used for different regions: gp41 LAI, Gag LAI, gp120 MN, gp120 SF2
- HLA-B60 responses dominated the responses against an Gag vaccine in an individual (022G0Z) who was HLA A1, A11, B8, B60. The strongest response was against the MN peptide 107-136. Low level Gag responses were observed against B8 and A11 epitopes, no response was observed against A1 epitopes.
- Vaccinee 202T7 (HLA A2, B27, C25) made the strongest response to an epitope at positions 131-140 of Gag. The response was highly cross-reactive with D clade Gag expressed from vaccinia, less so with C, and only minimally cross-reactive with A and CRF01.

HXB2 Location Gag**Author Location** p24**Epitope****Immunogen** Vaccine

Vector/Type: DNA
HIV component: p17/p24 Gag

Species (MHC) mouse (H-2^b, H-2^d, H-2^k)**References** Iroegbu *et al.* 2000

- The p24 sequence is more conserved than is p17 within patient, and nonsynonymous substitutions are spread evenly throughout its coding regions, not concentrated in CTL epitopes.
- Minor changes in p24 did not alter the immunogenicity in H-2b,d, or k mice, while changes in p17 (92% similarity) did alter immunogenicity.

HXB2 Location Gag**Author Location** Gag (SF2)**Epitope****Immunogen** Vaccine

Vector/Type: DNA, vaccinia
Strain: B clade SF2
HIV component: Gag, Pol

Species (MHC) mouse (H-2^{bxd})**References** Otten *et al.* 2000

- CB6F1 were primed with gag DNA by im injection and challenged with vaccinia expressing Gag/Pol (rVVgag-pol)
- Gag-specific CTL responses were detected by IFNgamma secretion in the spleen, independent of the route (intraperitoneal, intranasal or intrarectal) of rVV gag-pol challenge.
- The gag DNA vaccine induced CTL responses in 4/4 monkeys 2 weeks post immunization, but antibody responses were detected in only 1/4 monkeys after 3 immunizations.
- CTL cross-reactivity against Gag sequences 1-80, 254-323, and 421-496 was observed, suggesting multiple CTL epitope recognition.

HXB2 Location Gag**Author Location** p24**Epitope****Immunogen** Vaccine

Vector/Type: DNA
HIV component: Gag

Species (MHC) mouse (H-2^d)**References** Qiu *et al.* 2000

- Mice were injected with plasmid DNA at 0, 2 and 4 weeks and lymphocyte proliferation was measured after 6 weeks with recombinant p24 protein.
- Secreted HIV-1 Gag expression vectors generated a stronger response than standard Gag or cytoplasmic Gag expression vectors.
- IFN-gamma levels were increased compared to an undetectable IL-4 response.
- CTL levels were also increased in secreted Gag expression vaccination studies.

HXB2 Location Gag**Author Location** Gag (SF2)**Epitope****Immunogen** Vaccine

Vector/Type: vaccinia
Strain: B clade SF2
HIV component: Gag, Protease

Species (MHC) macaque, mouse (H-2^d)**References** zur Megede *et al.* 2000

- Sequence-modified Rev-independent gag and gag-protease gene constructs lead to increased expression levels and elevated CTL and antibody immunogenicity in BALB/c and CB6F1 mice.
- A CTL response in mice could be detected after a single immunization with codon-optimized gag, using 2 ng of plasmid; wild type gag required 200 ng to detect a response.
- Recognition of 3 different Gag peptide pools was observed, indicating a polyclonal CTL response.
- Significant gag-specific CTL responses were detected in 4/4 rhesus monkeys, in contrast to 1/4 using wildtype gag.

HXB2 Location Gag**Author Location** p24**Epitope**

- Immunogen** Vaccine
Vector/Type: coxsackievirus *HIV component:* p24 Gag
- Species (MHC)** mouse (H-2^d)
- References** Halim *et al.* 2000
- An avirulent recombinant coxsackievirus (CB4-P) construct was generated that can express p24 Gag sequences – CB4-P is attenuated even in immunodeficient mice and T help responses can be elicited from peptides embedded in a surface loop of the VP1 capsid.
 - This paper describes the vaccine strategy and generation of constructs, and employs amino-terminal fusion of Gag sequences to the viral polyprotein with subsequent cleavage to elicit CTL responses via MHC class I presentation in BALB/c mice.
- HXB2 Location** Gag

Vector/Type: Listeria monocytogenes
Strain: B clade HXB2 *HIV component:* Gag

Species (MHC) mouse (H-2^d, H-2^b)

Keywords review, Th1

References Mata & Paterson 2000

- BALB/c and C57BL/6 mice were immunized with recombinant Listeria monocytogenes (Lm-Gag) expressing HIV-1 HXB2 Gag and mice were challenged with vaccinia expressing Gag.
- L. monocytogenes is a gram-positive bacteria that enters the macrophage on phagocytosis and lives in the cytoplasm – secreted L. monocytogenes antigens are processed and presented by both class I and class II pathways.
- This article is a review of L. monocytogenes biology and its potential as a vaccine vector for HIV, comparing to other vector systems, and discussing CD4+ Th1 T-cells mediated Gag specific immunological protection in mice and the Gag CTL response.

II-B-7 Gag/Pol CTL, CD8+, epitopes

HXB2 Location Gag/Pol

Author Location Gag/Pol (ARV-2 SF2)

Epitope

Immunogen Vaccine

Vector/Type: fowlpoxvirus *Strain:* B clade ARV-2, B clade SF2 *HIV component:* Gag, Pol *Adjuvant:* IFN γ

Species (MHC) macaque

References Kent *et al.* 2000

- Vaccination with FPV Gag/Pol-IFN-gamma increased HIV-1 specific CTL and T cell proliferative responses to Gag/Pol antigens, respectively, in infected Macaca nemestrina.
- HIV-1 viral loads remained low and unchanged following vaccinations.

HXB2 Location Gag/Pol

Author Location RT

Epitope

Immunogen Vaccine

Vector/Type: DNA *HIV component:* Env, Gag, Pol, Vif *Adjuvant:* B7, IL-12

Species (MHC) mouse

References Kim *et al.* 1997d

- A Gag/Pol or Env DNA vaccine, when delivered in conjunction with the plasmid encoding the co-stimulatory molecules CD86, gave a dramatic increase in both the cytotoxic and proliferative responses in mice.
- When CD86 was present, CTL response could be detected even without *in vitro* stimulation.

HXB2 Location Gag/Pol

Author Location RT

Epitope

Immunogen HIV-1 infection

Species (MHC) human

Keywords TCR usage

References Gamberg *et al.* 1999

- 13/13 subjects with advanced HIV infections showed CD8 T cell proliferation and differentiation of CTL *in vitro*, and six individuals showed HIV-specific responses to Gag, Pol, Env or Nef antigens.
- Data suggests that the functional and genetic integrity of the CD8 T cell repertoire (TCR V β gene intrafamily genetic diversity) remains intact through advanced HIV infection, although HIV-specific CTL activity decreases.

HXB2 Location Gag/Pol

Author Location

Epitope

Immunogen Vaccine

Vector/Type: adenovirus *HIV component:* Gag-Pol, Nef, Vpr

Species (MHC) mouse

References Muthumani *et al.* 2002

- Vpr can cause cells to go into G2 arrest, and it suppresses immune cell activation and inflammatory cytokine production, so co-immunization of BALB/c mice with recombinant adenovirus expressing Vpr and HIV-1 antigens Nef or Gag/Pol was tested to see if Vpr reduced the immune response to the other HIV antigens.
- Vpr compromised CD8+ T-cell lytic responses and T-helper proliferative responses in mice co-immunized with Vpr and Nef or Gag/Pol.
- In vitro, Vpr reduced T-cell cytokine production of IL-12 and TNF α , indicative of Vpr-mediated immune suppression.

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag

Species (MHC) human (A*6802)

Keywords inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ ELISPOT assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Epitope VTIKIGGQLK

Epitope name Pol 98

Subtype M

Immunogen Vaccine, in vitro stimulation or selection, computer prediction

Vector/Type: DNA, peptide **Adjuvant:** Incomplete Freund's Adjuvant (IFA)

Species (MHC) human, mouse, humanized mouse (A*1101)

Assay type cytokine production, T-cell Elispot

Keywords inter-clade comparisons, computational epitope prediction, escape, TCR usage, variant cross-recognition or cross-neutralization

References McKinney *et al.* 2004

- This study examined variant recognition of epitopes presented by A*0201 and A*1101. Numerous amino acid substitutions can be introduced into epitopes without disrupting their recognition by CTLs, although epitopes with multiple substitutions were less recognized. An algorithm was constructed for prediction of epitopes capable of inducing responses to a great number of variant epitopes.
- A total of 30 variant forms of Pol 98 were identified. 50% of the variant epitopes were recognized by CTLs from mice immunized with the parental form.
- Pol 98 epitope was present in 71% of HIV sequences of many M group subtypes.

HXB2 Location Protease (11–20)

Author Location Pol (91–100)

Epitope VTILIGGQLK

Immunogen HIV-1 infection

Species (MHC) human (A3 supertype)

Keywords supertype, rate of progression

References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind 3/5 HLA-A3 supertype alleles (A*0301, A*1101, A*3101, A*3301 and A*6801).

Species (MHC) human (A*6802)

Keywords HIV exposed persistently seronegative (HEPS), escape

References Kaul *et al.* 2001c

- This study examines CTL responses in HIV exposed, persistently seronegative individuals, HEPS, who eventually seroconverted – 11/114 HEPS Nairobi sex workers eventually seroconverted, and for six of these HIV CTL reactive epitopes had been defined while seronegative.
- DTVLEDINL was recognized in 3 of the 6 women (ML857, ML1203, and ML1707), and the response was present in the last available sample prior to seroconversion, 3–7 months.
- In each of the three women, 20/20 sequences of the infecting strain had no substitutions in this epitope, all were DTVLEDINL, so there was no evidence for escape.
- The epidemiological factor associated with seroconversion was stopping sex work. HIV-specific CTL activity declined when HEPS sex workers stopped working for a period or retired.
- This epitope was recognized in 3/22 HEPS sex worker controls, ML851, ML1432, and ML1601.

Epitope DTVLEDINL

Immunogen HIV-1 infection, HIV-1 exposed seronegative

Species (MHC) human (A*6802)

Keywords HIV exposed persistently seronegative (HEPS), immunodominance

References Kaul *et al.* 2001a

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.

- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-A*6802 women, 11/12 HEPS and 6/11 HIV-1 infected women recognized this epitope likelihood ratio 4.4, p value 0.08, and HEPS women tended to respond to DTVLEDINL, infected women tended to ETAYFILKL.
- The dominant response to this HLA allele was to this epitope in 10 of the 11/12 HEPS cases, but in only 4 of the 6/11 HIV-1 infected women.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.
- Four epitopes were considered to be “resistant epitopes”, as they were preferentially reactive in HEPS women and so may confer resistance, and these were found in three different proteins: A2 ILK(D/E)PVHGV in RT, A*6802 DTVLEDINL in Protease, B14 DLN(M/T)LN(I/V)V in p24 and B18 FRDYV-DRF(Y/F)K also in p24.
- Subject ML 857 shifted from a A*6802 DTVLEDINL and B35 (H/N)PDIVYQY response prior to seroconversion to a B35 PPIPVGDIY and B35 VPLRPMY response post-seroconversion, and the loss of the pre-seroconversion response was not due to sequence variation within these epitopes.
- Subject ML 1203 started with CTL responses to A*6802 DTVLEDINL and B7 FVPTQVPLR prior to seroconversion, and upon seroconversion acquired additional responses to A*6802 ETAYFILKL which became dominant, B7 TPGPGV/IRYPL, B7 IPRRIRQGL, and B7 SPRTLNAWV.
- Subject ML 1707 started with a CTL response to A*6802 DTVLEDINL prior to seroconversion, and switched to A*6802 ETAYFILKL and A24 RDYVDRFFKTL post-seroconversion, and the loss of the pre-seroconversion response was not due to sequence variation within the epitope.
- Subject ML 1830 made no detectable response prior to seroconversion, but responded to A*6802 DTVLEDINL and A*6802 ETAYFILKL post-seroconversion.

Country United States.

Assay type CD8 T-cell Elispot - IFN γ , Intracellular cytokine staining, Chromium-release assay, Flow cytometric CTL assay

Keywords epitope processing, supervised treatment interruptions (STI), immunodominance

References Rodriguez *et al.* 2004

- Protease and Integrase are shown to be frequently targeted by CD8 T-cell responses (23% and 68% of 56 HIV+ patients, respectively). Responses tend to cluster in conserved regions of Integrase, although one high conserved region had no responses. CTL frequencies per unit protein length for Protease and Integrase were similar to other HIV non-structural proteins. Three novel, HLA class I-restricted optimal epitopes were found and characterized with fine mapping.
- The epitope includes residue M36 which is a known accessory mutation site in individuals treated with PIs.

Epitope LVGPTPVNI

Epitope name Pol-163

Immunogen HIV-1 infection

Species (MHC) human (A*0201)

Keywords binding affinity, inter-clade comparisons, supertype, computational epitope prediction

References Altfeld *et al.* 2001c

- HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested.
- Three additional previously described HLA-A2 epitopes were added to the set of 20, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2)
- LVGPTPVNI binds to 4/5 HLA-A2 supertype alleles: A*0201, A*0202, A*0206 (highest affinity) and A*6802, but not A*0203.
- 1/22 individuals with chronic HIV-1 infection recognized this epitope by ELISPOT.
- 0/12 acutely infected individuals recognized this epitope.

HXB2 Location Protease (76–84)

Author Location Protease (76–84 HXB2)

Epitope LVGPTPVNI

Epitope name PR82V

Immunogen HIV-1 infection

Species (MHC) human (A2)

Assay type Intracellular cytokine staining, Chromium-release assay

Keywords HAART, ART, escape

References Karlsson *et al.* 2003

- This epitope contains two positions that are commonly associated with protease inhibitor escape, lvgtptAni (V82A) and lvgtptvnV (I84V). 29 HIV-1 infected patients (15 were HLA-A2+) with a history of protease inhibitor failure were screened for mutations within the protease gene and CD8+ T cells recognition of the wt and V82A variant peptides. CTL pressure alone, despite high functional avidity, did not drive the V82A substitution. Surprisingly V82A was found more frequently among HLA-A2- individuals (10/14) than HLA-A2+ (7/15), despite the mutation conferring not only drug resistance but CTL escape.
- 8/15 HLA-A2+ patients carried had a Val at position 82; 7/8 of these recognized the WT peptide, but only 3/8 could also recognize V82A.

- 7/15 had the V82A substitution; 2/7 recognized the wt and the V82A mutation, 1/7 recognized only the peptide with the V82A substitution.

Epitope ALVEICTEM

Subtype B

Immunogen Vaccine

Vector/Type: DNA, polyepitope *Strain:* B clade MN *HIV component:* gp120, Protease, RT *Adjuvant:* Incomplete Freund's Adjuvant (IFA)

Species (MHC) humanized mouse (A*0201)

Assay type CD8 T-cell Elispot - IFN γ

Keywords epitope processing, vaccine-specific epitope characteristics, immunodominance, immunotherapy

References Isaguliantis *et al.* 2004

- Immunization of HLA-A*0201-transgenic mice with synthetic genes encoding clusters of human A*0201 CTL epitopes located at the sites of drug resistance mutations, induced RT-specific cellular responses indicating the immunogenicity of these constructs. This vaccine strategy may be a first step towards a therapeutic vaccine against drug-resistant strains.
- This was one of five HLA-A*0201 epitopes from the RT or protease proteins that was included in the polyepitope vaccine. When the transgenic HLA A*0202 mice were vaccinated with the polyepitope construct or with a mixture of RT peptides, a sustained low level CD8+ T-cell gamma IFN response was observed, in contrast to when an intact RT gene was used for vaccination.

HXB2 Location RT (33–41)

Author Location Pol (132–140 IIIB)

Epitope ALVEICTEM

Epitope name pol132-140

Subtype B

Immunogen Vaccine

Vector/Type: DNA *Strain:* B clade IIIB

HIV component: Gag-Pol

Species (MHC) humanized mouse (A*0201)

Assay type Intracellular cytokine staining

Keywords inter-clade comparisons, vaccine-specific epitope characteristics, immunodominance, variant cross-recognition or cross-neutralization, vaccine antigen design

References Singh & Barry 2004

- When A*0201-C3H/J transgenic mice were immunized with plasmids encoding wild-type gag-pol, codon-optimized (CO) gag-pol, and an expression library vaccine expressing 16 fragments of gag-pol fused with ubiquitin for proteasome targeting (ELI), the ELI vaccine produced up to 10-fold higher CD8 T-cell responses than the other two vaccines. In contrast to the wt and CO vaccines, which tended to augment only immunodominant responses, boosting with the ELI vaccine resulted in many CD8 responses against variant epitopes from different HIV-1 clades, and against drug-resistant variants.
- Different variants of this epitope from different clades were tested. WT and CO vaccines produced low level CD8+ T-cell responses against the B clade form as well as against variants from other clades, but the ELI vaccine produced much more intense responses against the B clade and all variants tested, including after boosting. The variants were: clade A, alTDicem; clade C, atTAicEem; and clade D, alleicSem.

Assay type CD8 T-cell Elispot - IFN γ , Flow cytometric CTL assay

Keywords escape

References Geels *et al.* 2003

- Both stable potential epitopes and epitopes with escape mutations were found in a patient with increasing viral load over a time period of 4 years. Fixation of escape mutations occurred sequentially and correlated with the rise in viral load and with the increased number of productively infected cells.
- This is one of 17 potential epitopes from this individual, defined based on previously identified epitopes presented by appropriate HLA molecules. Full length genome sequence did not reveal changes in time in any of these epitopes over a four year period. Peptide pools initially revealed very little response to these epitopes, but this increased over time.

HXB2 Location RT (57–65)

Author Location Pol (236–244)

Epitope NTPVFAIKK

Immunogen HIV-1 infection

Species (MHC) human (A3 supertype)

Keywords supertype, rate of progression

References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNP.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNP to clear virus.
- This epitope can bind 3/5 HLA-A3 supertype alleles (A*0301, A*1101, A*3101, A*3301 and A*6801).

Epitope GIPHPAGLKK

Epitope name P248-257

Subtype CRF01_AE

Immunogen HIV-1 exposed seronegative

Species (MHC) human (A11)

Keywords HIV exposed persistently seronegative (HEPS)

References Sriwanthana *et al.* 2001

- This was a study of HIV-1 exposed persistently seronegative (HEPS) female sex workers in Chiang Mai, northern Thailand.
- HLA-A11 is very common in this population, and was enriched among the HEPS sexworkers – weak CTL responses were detected in 4/7 HEPS women, and CTL responses were found in 8/8 HIV+ controls, and 0/9 HIV- women that were not exposed.
- This epitope was weakly reactive in the HEPS study subject 265 who was HLA A2/A11 and after a second stimulation *in vitro* gave a strong response in HEPS study subject 128 who was HLA A11/A33.

Epitope GIPHPAGLKK

Subtype CRF01_AE

Immunogen HIV-1 infection

Species (MHC) human (A11)

Keywords inter-clade comparisons

References Bond *et al.* 2001

- HLA-A11 CRF01 (called subtype E in Bond *et al.*) epitopes were identified that stimulated CTL from HIV+ female sex workers (FSW) from Northern Thailand, of whom more than half were HLA-A11 positive.
- 77 possible HLA-A11 epitopes were first defined using EpiMatrix, these were screened for binding to A11 finding and 26 bound, and 12 of these were epitopes for CTL responses from 8 HLA-A11 positive FSWs, six were novel, six were previously identified.
- This is one of the new A11 epitopes identified through the streamlined EpiMatrix method, and 2/8 tested FSWs recognized it.
- This epitope was highly conserved in other subtypes, and exact matches were common.

HXB2 Location RT (98–113)

Author Location Pol (254–264 BH10, LAI)

Epitope AGLKKKSVTVLDVGD

Immunogen HIV-1 infection

Species (MHC) human

References Maksiutov *et al.* 2002

- This study employs an antigenic similarity matrix to compare HIV-1 antigenic determinants with human proteins.
- This CTL epitope (the HIV-1 LAI fragment with high similarity to a human protein overlapping this epitope is GLKKKSVTVL) has similarity with the CD166 antigen (activated leukocyte-cell adhesion molecule), fragment GLKKRESLTLI.

HXB2 Location RT (98–113)

Author Location RT (252–266)

Epitope AGLKKKSVTVLDVGD

Immunogen HIV-1 infection

Species (MHC) human (Cw4)

References Bernard *et al.* 1998

- This study focuses on six rare long-term survivor HIV-infected people who were infected for many years without exhibiting immune dysregulation – such immunologically normal HIV-infected (INHI) cases occur at a frequency between 0.1 and 1% in the infected population.
- No direct CTL were found in any of the six INHIs, but above background CTLp activity was founded in 3/6 INHIs.

HXB2 Location RT (103–117)

Author Location RT (257–251)

Epitope KKSVTVLVDVGDAYFS

Immunogen HIV-1 infection

Species (MHC) human (Cw4)

References Bernard *et al.* 1998

- This study focuses on six rare long-term survivor HIV-infected people who were infected for many years without exhibiting immune.
- No direct CTL were found in any of the six INHIs, but above background CTLp activity was founded in 3/6 INHIs.

HXB2 Location RT (107–115)

Author Location RT (262–270 IIIB)

Epitope TVLDVGDAY

Immunogen

Species (MHC) (B*3501)

Keywords optimal epitope

References Frahm *et al.* 2004

- C. Brander notes this is a B*3501 epitope.

HXB2 Location RT (107–115)

Author Location RT (262–270 IIIB)

Epitope TVLDVGDAY

Immunogen HIV-1 infection

Species (MHC) human (B35)

Keywords review, responses in children, mother-to-infant transmission

References Menendez-Arias *et al.* 1998; Wilson *et al.* 1996

- Epitope defined in the context of the Pediatric AIDS Foundation ARIEL Project, a mother-infant HIV transmission study.
- TVLDMGDAC is a naturally occurring variant that is less reactive.
- Menendez-Arias *et al.* [1998], in a review, notes that this epitope includes a catalytic residue (Asp-110) in the active site of RT.

HXB2 Location RT (107–115)

Author Location Pol (262–270 IIIB)

Epitope TVLDVGDAY

Immunogen HIV-1 infection

Species (MHC) human (B35)

Keywords responses in children, mother-to-infant transmission, escape

References Wilson *et al.* 1999a

- This study describes maternal CTL responses in the context of mother-to-infant transmission.

- Detection of CTL escape mutants in the mother was associated with transmission, but the CTL-susceptible forms of the virus tended to be found in infected infants.
- An additional variant that gave a positive CTL response: TVLDMGDAC.

HXB2 Location RT (107–115)

Author Location Pol (262–270)

Epitope TVLDVGDAY

Immunogen HIV-1 infection

Species (MHC) human (B35)

References Ferrari *et al.* 2000

- One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.

HXB2 Location RT (107–115)

Author Location RT (262–270 SF2)

Epitope TVLDVGDAY

Immunogen HIV-1 infection

Species (MHC) human (B35)

Keywords HAART, ART, acute infection

References Altfeld *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-B35+ individuals that had a CTL response to this epitope broken down by group: 1/2 group 1, 0/2 group 2, and 0/1 group 3.

HXB2 Location RT (107–115)

Author Location

Epitope TVLDVGDAY

Epitope name Pol-TY9

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B35)

References Sabbaj *et al.* 2002b

- Among HIV+ individuals who carried HLA B35, 8/21 (38%) recognized this epitope.

HXB2 Location RT (107–115)

Author Location Pol

Epitope TVLDVGDAY

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B35)

Donor MHC A3, A11, B35, B51

Keywords mother-to-infant transmission

References Sabbaj *et al.* 2002a

- IFN γ T-cell responses in breast milk of 5 HIV-1 infected women from the US and 6 from Zambia were tested with using Elispot. 11/11 women responded to Gag, 8/11 responded to Pol, 7/11 women to Nef, and 2/5 women to Env peptide pools. These responses were shown to be primarily due to CD8+ T-cells in one woman, and another woman had cytolytic responses measured by Cr-release.
- T-cells in breast milk from a volunteer who was HLA A3, A11, B35, B51 induced IFN γ after stimulation with either of two overlapping peptides that carry known B35 epitope TVLDVGDAY.
- The frequencies of responses in the two compartments differed, and 2/4 women that responded to epitopes in Nef 101-205 and Pol 601-710 showed responses in breast milk but no detectable responses in peripheral blood cells.

HXB2 Location RT (107–115)

Author Location RT (107–115)

Epitope TVLDVGDAY

Subtype AG

Immunogen HIV-1 infection

Species (MHC) human (B35)

Country Canada.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords HAART, ART, immunotherapy, variant cross-recognition or cross-neutralization

References Mason *et al.* 2004

- Accumulation of specific antiretroviral drug-resistance mutations in Pol gene was shown to sustain and even enhance the antigenicity and immunogenicity of HIV-1 CTL epitopes in this region. Several different patterns of cross-reactivity and selective recognition of wild-type and variant epitopes were found.
- TiLDVGDAY, TVLDVGDAf and TiLDVGDAf variants are detected due to appearance of V108I and Y115F resistance mutations. Complete cross-reactivity of wild-type and variant peptides was observed.

HXB2 Location RT (107–115)

Author Location RT Pol (262–270)

Epitope TVLDVGDIY

Immunogen HIV-1 infection

Species (MHC) human (B35)

Country Spain.

Assay type proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric CTL assay

Keywords HAART, ART, supervised treatment interruptions (STI), immune dysfunction

References Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load.
- 5/9 patients recognized this epitope.

HXB2 Location RT (108–118)

Author Location RT (267–277)

Epitope VLDVGDAYFSV

Immunogen *in vitro* stimulation or selection

Species (MHC) human (A*0201)

References van der Burg *et al.* 1996

- High dissociation rate, but immunogenic in primary CTL induction after repeated stimulations with peptide.
- CTL generated by *in vitro* stimulation of PBMC derived from uninfected individual.

HXB2 Location RT (108–118)

Author Location RT (267–277)

Epitope VLDVGDAYFSV

Immunogen HIV-1 infection

Species (MHC) human (A2)

Keywords dendritic cells

References Kundu *et al.* 1998b

- Allogeneic dendritic cells (DCs) were obtained from HLA-identical siblings, pulsed with rgp160 MN or A2-restricted HIV-1 epitope peptides, and infused monthly into six HIV-infected patients.
- 1/6 showed increased env-specific CTL and increased lymphoproliferative responses, 2/6 showed increase only in proliferative responses, and 3/6 showed no change – pulsed DCs were well tolerated.
- VLDVGDAYFSV is a conserved HLA-A2 epitope included in this study – 4/6 patients had this sequence as their HIV direct sequence, but only one of these had a detectable CTL response – the other two had the sequences EEDVGDAYFSV and ELDVGDYFSV and no detectable CTL response.

HXB2 Location RT (108–118)

Author Location RT (267–277)

Epitope VLDVGDAYFSV

Immunogen *in vitro* stimulation or selection

Species (MHC) human (A2)

References van der Burg *et al.* 1995

- Binds HLA-A*0201 – CTL generated by *in vitro* stimulation of PBMC from an HIV negative donor.
- VLDVGDAYFSV is in a functional domain.

Epitope DAYFSVPL

Immunogen HIV-1 infection

Species (MHC) human (B*5101, B24)

Keywords inter-clade comparisons, rate of progression

References Tomiyama *et al.* 1999

- HLA-B27, -B51, and -B57 are associated with slow progression to AIDS, while HLA -B35, -B8, -B24 are associated with a rapid progression to AIDS (Nat. Med. 2:405, 1996; Lancet 22:1187, 1986; Hum Immunol 22:73, 1988; Hum Immunol 44:156, 1995)
- 15% of Japanese populations carry HLA-B51 while HLA-B27 and -B57 are detected in less than 0.3%
- Of the 172 HIV-1 peptides with HLA-B*5101 anchor residues, 33 bound to HLA-B*5101, seven of these peptides were reactive with CTL from 3 B*5101 positive individuals, and six were properly processed.
- Four of the six epitopes were highly conserved among B subtype sequences, DAYFSVPL is conserved.

HXB2 Location RT (113–120)

Author Location RT (113–120)

Epitope DAYFSVPL

Immunogen HIV-1 infection

Species (MHC) human (B51)

Donor MHC A03, A32, B51, B15, Cw03, Cw06, DR4, DR8, DQ7

Country Netherlands.

Assay type CD8 T-cell Elispot - IFN γ , Flow cytometric CTL assay

Keywords rate of progression, escape

References Geels *et al.* 2003

- Both stable potential epitopes and epitopes with escape mutations were found in a patient with increasing viral load over a time period of 4 years. Fixation of escape mutations occurred sequentially and correlated with the rise in viral load and with the increased number of productively infected cells.

- This is one of 17 potential epitopes from this individual, defined based on previously identified epitopes presented by appropriate HLA molecules. Full length genome sequence did not reveal changes in time in any of these epitopes over a four year period. Peptide pools initially revealed very little response to these epitopes, but this increased over time.

Epitope VPLDEDFRKY

Subtype C

Immunogen HIV-1 infection

Species (MHC) human (B*35)

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cell responses

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location RT (118–127)

Author Location RT (273–282 SF2)

Epitope VPLDKDFRKY

Immunogen HIV-1 infection

Species (MHC) human (B*3501)

Keywords review

References Menendez-Arias *et al.* 1998; Tomiyama *et al.* 1997

- A CTL clone responsive to this epitope was obtained.
- 4/7 B35-positive individuals had a CTL response to this epitope.
- A K to E substitution at position 5 abrogates specific lysis, and reduces binding to B*3501.
- Menendez-Arias *et al.* [1998], in a review, notes that a Glu to Lys (E to K) change abrogates CTL activity, but that both VPLDEDFRKY and VPLDKDFRKY can serve as HLA-B35 epitopes, so the change must alter T cell receptor binding – residues in this epitope may be important for polymerase activity.

Assay type CD8 T-cell Elispot - IFN γ

Keywords binding affinity, acute infection, early-expressed proteins

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.

- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Keywords binding affinity, inter-clade comparisons, supertype, computational epitope prediction
References Altfeld *et al.* 2001c
- HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested.
 - Three additional previously described HLA-A2 epitopes were added to the set of 20, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2)
 - 2/22 individuals with chronic HIV-1 infection recognized this epitope in ELISPOT.
 - 0/12 acutely infected individuals recognized this epitope.
 - YTAFTIPSI binds to five HLA-A2 supertype alleles: A*0201, A*0202, A*0203, A*0206 and A*6802 (highest affinity)

- HXB2 Location** RT (127–135)
Author Location Pol (306–314)
Epitope YTAFTIPSI
Immunogen HIV-1 infection
Species (MHC) human (A2 supertype)
Keywords supertype, rate of progression
References Propato *et al.* 2001
- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
 - Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
 - A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
 - This epitope can bind all five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802)

Assay type CD8 T-cell Elispot - IFN γ

Keywords binding affinity, acute infection, early-expressed proteins

References Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN- γ secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

Keywords supervised treatment interruptions (STI), immunodominance, early treatment

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started

treatment during acute infection, 11 continuously treated and 11 with STL.

- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 19% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Epitope AIFQSSMTK
Immunogen HIV-1 infection
Species (MHC) human (A*0301)
Keywords acute infection
References Wilson *et al.* 2000a
- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load was also found.
 - All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
 - ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWILGGLNK.
 - The subject with A*0201 had a moderately strong response to SLYNTVATL.
 - Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.
 - No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

Epitope AIFQSSMTK
Subtype A, B, C, D
Immunogen HIV-1 infection, Vaccine
Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost **Strain:** A clade
HIV component: p17 Gag, p24 Gag
Species (MHC) human, macaque (A*0301, A11, A33)
Keywords inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance
References Hanke & McMichael 2000; Wee *et al.* 2002
- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected

to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polypeptide string Hanke & McMichael [2000].

- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ ELISPOT assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polypeptide region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polypeptide string Wee *et al.* [2002].

Epitope MTKILEPFR

Immunogen HIV-1 infection

Species (MHC) human (A3 supertype)

Keywords supertype, rate of progression

References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNP.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNP to clear virus.
- This epitope can bind 4/5 HLA-A3 supertype alleles (A*0301, A*1101, A*3101, A*3301 and A*6801).

Epitope KQNPDIIVY

Epitope name KY9 (RT-53)

Immunogen HIV-1 infection

Species (MHC) human (A*3002)

References Goulder *et al.* 2001a

- HLA-A*3002 is very common in African populations, 50% of Zimbabweans express HLA-A30, 44% in African Zulu, so five new HIV epitopes were characterized that are presented by this HLA molecule.
- A rapid method was developed combining ELISPOT with intracellular IFN- γ staining of PBMCs to map optimal epitopes, then HLA presenting molecules were defined – this method was completed within 48 to 72 hours of receipt of blood.
- Two individuals were studied: Subject 199 (HLA A*0201/*3002 B*4402/51 Cw2/5), a Caucasian, and Subject 6007 (HLA A*3002/ B53/*5801 Cw4/7) an African-Caribbean.
- In both HLA-A*3002 individuals the response to RSLYNT-VATLY was dominant.
- In subject 199 four additional A*3002 epitopes were identified.
- Three quantitative assays, ELISPOT, precursor frequency and chromium release, confirmed a hierarchy of response: RY11 (p17) > KY9 (gp41) > KY9 (RT-53) > IY9 (gp41)

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cell responses

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

References Moore *et al.* 2002b
 • HIV polymorphisms in the RT protein were examined relation to HLA alleles found in a population of 473 participants in the Western Australian HIV Cohort Study. 64 significant associations between polymorphisms at particular positions and HLA alleles were detected, for HLA-B7, -B12, -B35 and -B15. Fifteen of these were in positions with known epitopes, 4 in anchor residues, 11 in other positions. Six additional polymorphic sites associated with particular HLA molecules flanked known epitopes and may relate to processing.
 • NPDIVYQY was one of two epitopes characterized in detail. D177x substitutions are known to specifically abrogate binding to HLA-B*3501, and not other B*35 subtypes. D177x substitutions were associated with people who carried HLA-B*3501 and not other B*35 subtypes; considering high resolution typing generally strengthened the B*35 associations.

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ IFN γ T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN γ secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes was characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

Immunogen

Species (MHC) human (B35)

References Rowland-Jones *et al.* 1999

- CTL responses in seronegative highly HIV-exposed African female sex workers in Gambia and Nairobi were studied – these women had no delta 32 deletion in CCR5.
- In Gambia there is exposure to both HIV-1 and HIV-2, CTL responses to B35 epitopes in exposed, uninfected women are cross-reactive, and the B35 allele seems to be protective.
- HIV-2 version of this epitope is not conserved: NPDVILIQY, but the CTLs are cross-reactive – one of five B35 CTL epitopes that are cross-reactive, see also Rowland-Jones *et al.* [1995]

HXB2 Location RT (175–183)**Author Location****Epitope** HPDIVIYQY**Immunogen** HIV-1 infection**Species (MHC)** human (B35)**Keywords** acute infection**References** Wilson *et al.* 2000a

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load was also found.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWILGGLNK.
- The subject with A*0201 had a moderately strong response to SLYNTVATL.
- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMYTK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.
- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

HXB2 Location RT (175–183)**Author Location** Pol (subtype A)**Epitope** HPDIVIYQY**Subtype** A**Immunogen** HIV-1 infection**Species (MHC)** human (B35)**Keywords** HIV exposed persistently seronegative (HEPS)**References** Kaul *et al.* 2001c

- This study examines CTL responses in HIV exposed, persistently seronegative individuals, HEPS, who eventually seroconverted – 11/114 HEPS Nairobi sex workers eventually seroconverted, and for six of these HIV CTL reactive epitopes had been defined while seronegative.
- HPDIVIYQY or NPDIVIYQY was recognized in 1 of the 6 women (ML857), and the response was present in the last available sample prior to seroconversion, 7 months.
- 20/20 sequences of the infecting strain had three substitutions in this epitope, all 20 were NpQiliyqy, and this form was not recognized by CTL from ML 857 – this was the only case in the study where a virus carrying an unrecognized form of the epitope broke through.
- The epidemiological factor associated with seroconversion was stopping sex work. HIV-specific CTL activity declined when HEPS sex workers stopped working for a period or retired.
- NPDIVIYQY was recognized by 1/22 HEPS control sex workers, ML887.

HXB2 Location RT (175–183)**Author Location** RT (175–183 SF2)**Epitope** NPDIVIYQY**Immunogen** HIV-1 infection**Species (MHC)** human (B35)**Keywords** HAART, ART, acute infection**References** Altfield *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-B35+ individuals that had a CTL response to this epitope broken down by group: 1/2 group 1, 0/2 group 2, and 1/1 group 3.

HXB2 Location RT (175–183)**Author Location** Pol (342–350)**Epitope** HPDIVIYQY**Immunogen** HIV-1 infection, HIV-1 exposed seronegative**Species (MHC)** human (B35)**Keywords** HIV exposed persistently seronegative (HEPS), immunodominance**References** Kaul *et al.* 2001a

- Variants (H/N)PDIVIYQY are specific for the A/B clades.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B35 women, 2/3 HEPS and 1/4 HIV-1 infected women recognized this epitope.
- The dominant response to this HLA allele was to this epitope in only one of the 2/3 HEPS cases, and was not to this epitope in the one responsive HIV-1 infected women.
- Subject ML 857 shifted from a A*6802 DTVLEDINL and B35 (H/N)PDIVIYQY response prior to seroconversion to a B35 PPIPVGDIY and B35 VPLRPMTY response post-seroconversion and the loss of the pre-seroconversion response was not due to sequence variation within these epitopes.

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade HIV component: p17 Gag, p24 Gag

Species (MHC) human, macaque (B35)**Keywords** inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance**References** Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ ELISPOT assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was

not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

HXB2 Location RT (175–183)**Author Location** Pol (342–350)**Epitope** HPDIIVYQY**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B35)**Country** United States.**Assay type** CD8 T-cell ELISPOT - IFN γ , CD8 T-cell ELISPOT granzyme B**Keywords** Th1, characterizing CD8+ T cell responses**References** Kleen *et al.* 2004

- Only 20% of CD8+ T-cells produce IFN- γ and granzyme B simultaneously (Tc1a). Two additional subpopulations of HIV specific CD8 cells are found, each one constituting 30-40% of the CD8 cell pool. One of these (Tc1b) secretes IFN- γ only, and the other one (Tc1c) secretes GzB only.
- None of three patients responded to this peptide with GzB producing cells, while one of the patients responded with IFN- γ producing cells.

HXB2 Location RT (175–183)**Author Location** RT Pol (330–338)**Epitope** HPDIIVYQY**Immunogen** HIV-1 infection**Species (MHC)** human (B35)**Country** Spain.**Assay type** proliferation, CD8 T-cell ELISPOT - IFN γ , Flow cytometric CTL assay**Keywords** HAART, ART, supervised treatment interruptions (STI), immune dysfunction**References** Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load.
- 5/9 patients recognized this epitope.

HXB2 Location RT (175–184)**Author Location** RT (175–184 LAI)**Epitope** NPDIIVYQM**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B51)**References** Samri *et al.* 2000

- This epitope contains the mutation M184V, a frequent mutation induced by nucleoside reverse transcriptase inhibitors.
- Patient 246#1 (B51), was found by ELISPOT to recognize the wild type and the mutated peptide after zidovudine treatment.
- The resistance mutation M184V gave an increased predicted binding score to B51 (http://bimas.dcrn.nih.gov/molbio/hla_bind) compared to the wildtype RT sequence and also an increased ELISPOT reactivity.

Epitope VIYQYMDDL
Immunogen HIV-1 infection
Species (MHC) human (A*0201)
Keywords epitope processing, immunodominance, escape
References Sewell *et al.* 1999
 • Proteasome regulation influences epitope processing and could influence patterns of immunodominance.
 • The proteasome is inhibited by lactacystin treatment, and gamma IFN induces expression of proteasome subunits, LMP2 and LMP7, which combine with the proteasome to create an immunoproteasome.
 • IFN-gamma induction of the immunoproteasome and lactacystin inhibition increases the presentation of the A*0201 VIYQYMDDL epitope, but decreases the presentation of the A*0201 ILKEPVHGV epitope, which is immunodominant within pol proteins, showing the two epitopes are processed by different pathways.

- ILKEPVHGV seems to be processed by the classical proteasome pathway, while VIYQYMDDL appears to be destroyed by this pathway.
- This epitope contains the catalytic site (YMDD) of RT, a conserved sequence in HIV-1 which restricts escape mutants.

Epitope VIYQYMDDL
Immunogen HIV-1 infection
Species (MHC) human (A*0201)
Keywords review, escape
References Brander *et al.* 1998a; Menendez-Arias *et al.* 1998
 • Of 17 infected HLA A*0201 subjects, 13 had CTL responses against the p17 SLYNTVATL epitope, six recognized ILKEPVHGV and five recognized VIYQYMDDL, and there was no correlation between viral load and recognition of a specific epitope or evidence of immune escape.
 • Only one subject had CTL against all three epitopes.
 • Subjects were part of the San Francisco City Clinic Cohort, the ARIEL project and from the Boston area.
 • In the review Menendez-Arias *et al.* [1998] the authors note that substitution of three residues in this epitope can confer resistance to RT inhibitors (1, 3, and 6) – substitutions V1E and M6V abolish CTL activity, and M6V confers resistance to 3TC – substitution Y3C reduces CTL activity and is associated with resistance to non-nucleoside RT inhibitors.

HXB2 Location RT (179–187)

Epitope VIYQYMDDL
Epitope name RT VL9
Immunogen HIV-1 infection
Species (MHC) human (A*0201)

Keywords inter-clade comparisons, supertype, computational epitope prediction

References Altfeld *et al.* 2001c

- HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested.
- Three additional previously described HLA-A2 epitopes were added to the set of 20, including RT VL9, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2)
- RT VL9 was not recognized by any of the 22 HLA-A2 patients with chronic HIV-1 infection or the 13 HLA-A2 patients with acute HIV-1 infection included in this study.

Epitope VIYQYMDDL

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A*0201)

Keywords epitope processing, immunodominance

References Sewell *et al.* 2002

- Epitope processing of three different HLA-A*0201 HIV epitopes was shown to use different pathways, which might influence patterns of immunodominance. 174 cells were used that lack TAP1 and TAP2 genes, as well as the LMP2 and LMP7 genes that encode the beta-subunits of the immunoproteasome. These genes could be added back through transfection to study processing.
- ILKEPVHGV was efficiently presented in TAP-1 and -2 transfected cells while VIYQYMDDL and SLYNTVATL were not. VIYQYMDDL was destroyed by the MB1 subunit of the protease, and could be expressed in the presence of the proteasome inhibitor lactacystin, but SLYNTVATL expression was not restored. SLYNTVATL expression was unaltered by lactacystin in a wild type cell line.

Epitope VIYQYMDDL

Subtype A, B, C, D

Immunogen HIV-1 infection, Vaccine

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost **Strain:** A clade
HIV component: p17 Gag, p24 Gag

Species (MHC) human, macaque (A*0201)

Keywords inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ ELISPOT assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Keywords HIV exposed persistently seronegative (HEPS)

References Sriwanthana *et al.* 2001

- This was a study of HIV-1 exposed persistently seronegative (HEPS) female sex workers in Chiang Mai, northern Thailand.
- HLA-A11 is very common in this population, and was enriched among the HEPS sexworkers – weak CTL responses were detected in 4/7 HEPS women, and CTL responses were found in 8/8 HIV+ controls, and 0/9 HIV- women that were not exposed.
- This epitope was reactive in HIV+ control study subject 144 who carried HLA-A2.

HXB2 Location RT (179–187)**Author Location** Pol (339–347 93TH253 subtype CRF01)**Epitope** VIYQYMDDL**Subtype** CRF01_AE**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Keywords** inter-clade comparisons**References** Bond *et al.* 2001

- More than half of a cohort of HIV+ female sex workers (FSW) from Northern Thailand were HLA-A11 positive, and this study concentrated on A11 epitopes in this group, although E clade versions of previously defined B-clade A2 and A24 epitopes were also tested.
- 2/4 tested FSWs recognized the E clade version of this epitope, which is identical to the previously defined B clade version VIYQYMDDL.
- This epitope was conserved in many subtypes, and exact matches were very uncommon.

HXB2 Location RT (179–187)**Author Location** RT (179–187)**Epitope** VIYQYMDDL**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Keywords** rate of progression, acute infection**References** Day *et al.* 2001

- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)
- 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.

HXB2 Location RT (179–187)**Author Location** Pol (346–354 LAI)**Epitope** VIYQYMDDL**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Keywords** HAART, ART, epitope processing**References** Kelleher *et al.* 2001a

- Ritonavir (RTV) inhibits chymotryptic activity in the 20S proteasome *in vitro*, as does Saquinavir (SQV) to a lesser extent; Indinavir (IDV) does not. Thus there is concern protease inhibitors may adversely effect CTL epitope processing, but this

paper indicates that processing is not inhibited at therapeutically relevant concentrations of RTV when the proteasome is functioning in an intracellular context.

- RTV did not alter the presentation two RT A2 epitopes processed by distinct pathways: ILKEPVHGV, generated by the constitutive proteasome containing the MB1 beta subunit, and VIYQYMDDL which is dependent on IFN γ induction of LMP7 which replaces MB1 in the immunoproteasome, and is destroyed by MB1 in the constitutive proteasome.
- RTV did not inhibit the processing and assembly of HLA-B35 or -A2, which are assembled with a rapid and moderate time course, respectively, or of HLA-A3, -B27 and -B39.

HXB2 Location RT (179–187)**Author Location** Pol (334–)**Epitope** VIYQYMDDL**Epitope name** Pol334**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Assay type** CD8 T-cell Elispot - IFN γ , Chromium-release assay, Flow cytometric CTL assay**Keywords** binding affinity, inter-clade comparisons, computational epitope prediction**References** Corbet *et al.* 2003

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This epitope was one of the previously identified HLA-A2 epitopes studied.
- 1/17 HIV-infected HLA-A2+ people in this study recognized this epitope.

HXB2 Location RT (179–187)**Author Location** Pol (334–342)**Epitope** VIYQYMDDL**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Donor MHC** A02, B35, Bw62**Assay type** proliferation, Chromium-release assay, Flow cytometric CTL assay**Keywords** HAART, ART, memory cells, immune dysfunction**References** Gamberg *et al.* 2004a

- HAART restores HIV specific immunity after advanced infection by increase of CD4+ and CD8+ T cell numbers after suppression of viral replication. However, HIV specific CTLs emerged only with detectable viral replication breakthroughs and were short-lived while CD4+ T-cell responses remained compromised, suggesting failure of generating stable CD8+ memory T-cells in the absence of HIV-specific T-helper responses.

Epitope IEELRQHLL

Immunogen HIV-1 infection

Species (MHC) human (B60)

Keywords HAART, ART, acute infection

References Altfeld *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.

- Number of HLA-B60+ individuals that had a CTL response to this epitope broken down by group: 0/2 group 1, 1/1 group 2, and 0/0 group 3.

Epitope IEELRQHLL

Epitope name IL9

Immunogen HIV-1 infection

Species (MHC) human (B60)

Donor MHC A2, A24, B38, B60, Cw2, Cw12

Assay type CD8 T-cell Elispot - IFN γ

Keywords HAART, ART, supervised treatment interruptions (STI), early treatment

References Montefiori *et al.* 2003

- HIV-1 + patient AC10 underwent early HAART treatment, which was discontinued 1.5 years later. At this timepoint potent NAb responses against autologous virus were detected. Treatment interruption initially induced weak CD8+ responses directed against 5 epitopes. By days 873d and 923d the CTL response had broadened to target 22 epitopes; of these six were fully characterized. Eventually the virus escaped the NAb response, but escape was not accompanied by a rise in viral load, and the authors suggest the virus was contained by the CTL response.

Epitope EELRQHLLR

Immunogen HIV-1 infection

Species (MHC) human (B44)

Donor MHC A*3101, A68, B*4403, B51

Keywords HAART, ART, supervised treatment interruptions (STI)

References Arnedo-Valero *et al.* 2004

- T cell immune responses following STI were monitored in two chronically HIV-1 infected partners (A and B) who had contracted HIV-1 during 1992. Both were heterozygous for the CCR5 delta32, and had different HLAs and treatment histories. STI induced strong transitory CD4+ and CD8+ T cell responses in both patients. Patient A displayed broad CD8+ T cell responses directed against Env, Pol, Gag, and Nef HIV-1 antigens. CTL responses in patient B were mainly directed against two epitopes: Gag(p24)NANPDSKTI and Pol(RT)EELRQHLLRW.
- Despite the host differences, both patients had similar dynamics of viral evolution and CD4+ T-cells, suggesting that good immune responses to STI may be more related to the virus than host characteristics in these cases.

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2–42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Epitope IVLPEKDSW
Subtype B
Immunogen HIV-1 infection
Species (MHC) (B57)
Keywords acute infection, early-expressed proteins, kinetics
References van Baalen *et al.* 2002
- Tat, Rev and Nef are the first HIV proteins expressed upon acute infection of T-cells (< 6 hours), and RT is not expressed until after 24 hours. The B14-restricted Rev-SAEPLVPLQL specific CD8 T-cell clone TCC108, and the B57-restricted RT-IVLPEKDSW specific CD8 T-cell clone TCL1C11 were co-incubated with CD4+ cultures inoculated with HIV-1 at low MOI. Co-incubation with the Rev-specific CTL resulted in two logs less HIV-1 production in ten days of culture. When the RT epitope was cloned into the Nef gene of the infecting strain, another early expressed protein, it proved as effective as the Rev epitope at inhibiting viral production. A mathematical model of CTL-target interactions suggest early proteins are important for vaccine design.

- Epitope** KLVGKLNWA
Immunogen HIV-1 infection
Species (MHC) human (A2 supertype)
Keywords supertype, rate of progression
References Propato *et al.* 2001
- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
 - Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
 - A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
 - This epitope can bind four of the five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802).
 - Tetramer staining with A2, beta2microglobulin, and either SLYNTVATL, KLVGKLNWA, or LTFGWCFKL revealed that tetramers detected more HIV-specific sells in LTNP than in progressors, activated effector cells were the minority population, and ELISPOT correlated better with the effector cell subpopulation than the total tetramer stained population.

Keywords characterizing CD8+ T cell responses

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.

- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Keywords HAART, ART, supervised treatment interruptions (STI)

References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient D displayed the greatest response to B27-KK10 (p24), and also responded to A30-RY11(p17), A32-PW10(RT), A30-KY11(RT), A32-RW10(gp120), and B18-YY9(Nef).

Epitope WASQIYPGKIKVRQLCKLLRG

Subtype C

Immunogen HIV-1 infection

Species (MHC) human

Keywords inter-clade comparisons

References Novitsky *et al.* 2002

- HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein.

- Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses.
- This peptide was among the 28 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.

HXB2 Location RT (268–282)

Author Location RT (SF2)

Epitope SQIYPGIKVRQLCKL

Immunogen HIV-1 infection

Species (MHC) human

References Altfield *et al.* 2001a

- HIV+ individual AC-06 was tested for reactive overlapping peptides spanning all HIV-1 proteins in an ELISPOT and was found to react with 12 peptides from 7 proteins, suggesting that the breadth of CTL responses are underestimated if accessory proteins are not included in the study.
- RT peptides SQIYPGIKVRQLCKL and WKG-SPAIFQSSMTKI were recognized.

HXB2 Location RT (269–277)

Author Location Pol (424–432)

Epitope QIYAGIKVK

Subtype B, CRF01_AE

Immunogen HIV-1 infection

Species (MHC) human (A*1101)

Keywords binding affinity, inter-clade comparisons

References Fukada *et al.* 2002

- binding affinity, inter-clade comparisons.
- Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A-E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals.
- QIYAGIKVK is commonly found in viruses representing subtypes A, B and E. It was strongly recognized by CTL from 1/5 B clade infected Japanese subjects, and 5/7 E clade infected Thai subjects.
- QIYAGIKVK had the highest A*1101 binding affinity, but qiyagikvR and qiyPgikvR (the most common C and D clade variant both bound to A*1101). QIYAGIKVK and qiyagikvR were both cross-presented by a clone from a B clade infection, but qiyPgikvR was not.

HXB2 Location RT (269–277)

Author Location (B consensus)

Epitope QIYAGIKVK

Epitope name QVK9

Immunogen HIV-1 infection

Species (MHC) human (A11)

Donor MHC A02, A11, B18, B44, Cw5, Cw12

Country United States.

Assay type cytokine production, Intracellular cytokine staining, Chromium-release assay, Flow cytometric CTL assay

Keywords assay standardization/improvement, memory cells, characterizing CD8+ T cell responses

References Lichterfeld *et al.* 2004c

- Using a flow-cytometric cytotoxicity assay based on caspase-3 activation in dying target cells, it was shown that the subset of HIV-1-specific CD8+ T-cells secreting both IFN-gamma and TNF-alpha exhibit stronger cytotoxic activity than those secreting only IFN-gamma. These cells also exhibited stronger intracellular perforin expression. No association between HIV-1-specific CD8+ T-cell maturation phenotypes and intracellular perforin expression was found.
- 1/9 individuals recognized this epitope.

HXB2 Location RT (269–277)

Author Location RT (269–277)

Epitope QIYPGIKVR

Immunogen HIV-1 infection

Species (MHC) human (A3)

Keywords rate of progression, acute infection

References Day *et al.* 2001

- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)
- 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.
- All patients recognized at least 1 A3 epitope, up to 8 A3 epitopes, but none was clearly dominant.

HXB2 Location RT (269–277)

Author Location RT (424–432)

Epitope QIYPGIKVR

Epitope name A3-QR9

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A3)

Donor MHC A3, B7, Cw7

Keywords dynamics, supervised treatment interruptions (STI), acute infection

References Yu *et al.* 2002a

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.

- 1/14 HLA-A3 positive individuals had detectable A3-restricted responses to this epitope during acute infection, but only 5/15 of HLA-A3 epitopes tested were targeted during acute infection. 4/7 individuals began to have detectable responses to this epitope after STI.

Immunogen HIV-1 infection

Species (MHC) human (A3)

Donor MHC A03, A32, B51, B15, Cw03, Cw06, DR4, DR8, DQ7

Country Netherlands.

Assay type CD8 T-cell Elispot - IFN γ , Flow cytometric CTL assay

Keywords rate of progression, escape

References Geels *et al.* 2003

- Both stable potential epitopes and epitopes with escape mutations were found in a patient with increasing viral load over a time period of 4 years. Fixation of escape mutations occurred sequentially and correlated with the rise in viral load and with the increased number of productively infected cells.
- This is one of 17 potential epitopes from this individual, defined based on previously identified epitopes presented by appropriate HLA molecules. Full length genome sequence did not reveal changes in time in any of these epitopes over a four year period. Peptide pools initially revealed very little response to these epitopes, but this increased over time.

HXB2 Location RT (271–279)

Subtype C

Immunogen HIV-1 infection

Species (MHC) human (B*4201)

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cell responses

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location RT (271–279)

Author Location RT (438–446 IIIB)

Epitope YPGIKVRQL

Immunogen HIV-1 infection

Species (MHC) human (B42)

Keywords responses in children, mother-to-infant transmission

References Menendez-Arias *et al.* 1998; Wilson *et al.* 1996

- YAGIKVRQL and YPGIKVKQL are naturally occurring variants that are both reactive.
- YHKIKVRQL is a naturally occurring variant that has not been tested.
- Epitope defined in the context of the Pediatric AIDS Foundation ARIEL Project, a mother-infant HIV transmission study.

HXB2 Location RT (271–279)

Author Location Pol (438–446 IIIB)

Epitope YPGIKVRQL

Immunogen HIV-1 infection

Species (MHC) human (B42)

Keywords mother-to-infant transmission, escape

References Wilson *et al.* 1999a

- This study describes maternal CTL responses in the context of mother-to-infant transmission.
- Detection of CTL escape mutants in the mother was associated with transmission, but the CTL-susceptible forms of the virus tended to be found in infected infants.
- An additional variant that gave a positive CTL response: YPGIKVKQL, YAGIKVRQL.
- YHGIKVRQL was an escape mutant.

Immunogen HIV-1 infection

Species (MHC) human (B*3501)

Donor MHC A*2402, A*2601, B*3501, B5101

Country Japan.

Assay type cytokine production, Tetramer binding, Chromium-release assay

Keywords binding affinity, kinetics, TCR usage, characterizing CD8+ T cell responses, immune dysfunction

References Ueno *et al.* 2004b

- Two different clonotypes of CD8+ T-cells with specificity for this epitope were isolated from a chronic HIV+ patient. The clonotype with the relatively high affinity TCR had no cytolytic activity, cytokine production or proliferation in response to HIV-infected cells, while the moderate affinity clonotype had strong reactions. More than 3-fold increased duration in tetramer 1/2 life was observed with the defective clonotype. The TCRs from the two clonotypes preserved the phenotype when transduced into primary CD8+ T cells, suggesting the TCR with higher affinity was directly associated with impaired T-cell reactivity of the cells.
- The high affinity impaired TCR was Valpha1.1/Vbeta13.3, the moderate affinity active TCR was Valpha12.1/Vbeta5.6.

HXB2 Location RT (293–301)

Assay type CD8 T-cell Elispot - IFN γ , Tetramer binding, CD4 T-cell Elispot - IFN γ

Keywords rate of progression, immunodominance, escape

References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0–80% as efficiently as the index peptide, and the relatively efficiency of the variant epitopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody

titers so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.

- The IPL epitope was found to be under positive selection for escape mutations and it was replaced by first variant between days 297 and 369, ipltGeael. This new variant was subsequently replaced by 2 further variants, that were even more resistant to CD8+ T cell recognition between days 369 and 635, ipltAeael and ipltVeael.

Epitope ILKEPVHGV**Immunogen** HIV-1 infection**Species (MHC)** human (A*0201)**Keywords** epitope processing, immunodominance**References** Sewell *et al.* 1999

- Proteasome regulation influences epitope processing and could influence immunodominance.
- The proteasome is inhibited by lactacystin treatment, and gamma IFN induces expression of proteasome subunits, LMP2 and LMP7, which combine with the proteasome to create an immunoproteasome.
- IFN-gamma induction of the immunoproteasome and lactacystin inhibition increases the presentation of the A*0201 VIYQYMDDL epitope, but decreases the presentation of the A*0201 ILKEPVHGV epitope, which is immunodominant within pol proteins, showing the two epitopes are processed by different pathways.
- ILKEPVHGV seems to be processed by the classical proteasome pathway, while VIYQYMDDL appears to be destroyed by this pathway.
- This epitope contains the catalytic site (YMDD) of RT, a conserved sequence in HIV-1 which restricts escape mutants.

HXB2 Location RT (309–317)**Author Location** Pol (476–484)**Epitope** ILKEPVHGV**Immunogen** HIV-1 infection**Species (MHC)** human (A*0201)**Keywords** epitope processing**References** Loing *et al.* 2000

- The ILKEPVHGV was modified by the addition of an N-palmitoyl-lysine residue at the P0, P1 or P10 positions of the parent peptide to create a lipopeptide for direct antigen delivery to the cytoplasm for processing.
- The N-terminal modification increased the life span for functional CTL recognition up to 48 hours in comparison to the parent peptide.

- ELISPOT was used to assay the CD8 T cell response to the HIV-1 proteins Gag, Pol, Nef or Env expressed in vaccinia or canarypox vectors in 19 HIV+ people.
- The highest CTL frequency was directed at epitopes in Pol.
- In A*0201 individuals, higher numbers of spot-forming T cells were directed against HIV-1 proteins expressed in vaccinia than to peptides SLYNTVATL and ILKEPVHGV presented by A2.

HXB2 Location RT (309–317)**Author Location** RT (476–484)**Epitope** ILKEPVHGV**Immunogen** HIV-1 infection**Species (MHC)** human (A*0201)**Keywords** TCR usage**References** Wilson *et al.* 1998a

- HIV+ individuals were followed longitudinally using MHC tetramers in combination with 14 anti-BV chain MAbs, and clonal expansion of HIV-specific T cells was followed *in vivo*.
- Seven HIV+ people were studied, and all showed expansions of particular TCR BV clones, often several, relative to uninfected controls.
- Three patients were followed in detail, TCR VB expansions persisted for 2 to 3 years, with occasional transient increases.

HXB2 Location RT (309–317)**Author Location** RT (476–484)**Epitope** ILKEPVHGV**Immunogen** HIV-1 infection**Species (MHC)** human (A*0201)**Keywords** immunodominance**References** Betts *et al.* 2000

- Only 4/11 HLA-A2+ HIV+ individuals had CTL that reacted to SLYNTVATL, calling into question whether it is immunodominant.
- 95 optimally-defined peptides from this database were used to screen for INF γ responses to other epitopes.
- 2/11 of the A2+ individuals responded to ILKEPVHGV, and neither of these two responded to SLYNTVATL.

HXB2 Location RT (309–317)**Author Location** Pol**Epitope** ILKEPVHGV**Immunogen** HIV-1 infection**Species (MHC)** human (A*0201)**Keywords** HAART, ART**References** Gray *et al.* 1999

- Administration of highly active antiretroviral therapy (HAART) reduced CD8+ cell frequency, and the CD8+ cells detected by tetramer staining were likely to be memory cells, indicating that persistently replicating viral populations are needed to maintain high frequencies of HIV-1 specific CTL.

HXB2 Location RT (309–317)**Author Location** RT (476–484)**Epitope** ILKEPVHGV**Immunogen** HIV-1 infection**Species (MHC)** human (A*0201)**References** Menendez-Arias *et al.* 1998; Ogg *et al.* 1998b

- HLA-tetrameric complexes were used in a cross-sectional study of 14 untreated HLA A*0201 positive individuals, revealing an inverse relationship between HIV Gag and Pol specific CTL effector cells (CTLe) and viral load.
- Inclusion of both the p17 SLYNTVATL and RT ILKEPVHGV epitopes gives a good representation of HLA A*0201-restricted activity.
- No correlation was observed between the CTLe and CD4 count or clearance rate of productively infected cells.

Keywords epitope processing, immunodominance

References Sewell *et al.* 2002

- Epitope processing of three different HLA-A*0201 HIV epitopes was shown to use different pathways, which might influence patterns of immunodominance. .174 cells were used that lack TAP1 and TAP2 genes, as well as the LMP2 and LMP7 genes that encode the beta-subunits of the immunoproteasome. These genes could be added back through transfection to study processing.

- ILKEPVHGV was efficiently presented in TAP-1 and -2 transfected cells while VIYQYMDDL and SLYNTVATL were not. VIYQYMDDL was destroyed by the MB1 subunit of the protease, and could be expressed in the presence of the proteasome inhibitor lactacystin, but SLYNTVATL expression was not restored. SLYNTVATL expression was unaltered by lactacystin in a wild type cell line.

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade
HIV component: p17 Gag, p24 Gag

Species (MHC) human, macaque (A*0201)

Keywords inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Immunogen in vitro stimulation or selection

Species (MHC) human (A*0201)

Keywords epitope processing, dendritic cells

References Andrieu *et al.* 2003

- This study demonstrates that lipopeptides carrying epitopes can be taken up by human dendritic cells, processed using different pathways, and recognized by epitope-specific CD8+ T-cells originally derived from HIV+ individuals. The RT ILKEPVHGV peptide was embedded in a longer peptide fragment in the lipopeptide, and was internalized by endocytosis and processed in the cytosol by proteasomal cleavage by following an endosome-to-cytosol pathway for processing and presentation. Administration of epoxomycin, a proteasome inhibitor, completely abrogated epitope presentation to a CD8+ T-cell line, while monensin, an inhibitor of acid-dependent endosomal enzyme activity did not.
- In contrast to the RT epitope, dendritic cell presentation of the Nef epitope QVPLRPMTYK embedded in a longer peptide in a lipopeptide was not inhibited by epoxomycin, but was inhibited by monensin, indicative of endocytotic epitope processing.

Species (MHC) human (A*0201)

Assay type cytokine production, proliferation, Tetramer binding, Intracellular cytokine staining, Chromium-release assay

References Dagarag *et al.* 2003

- Telomer length is short in the CD8+ T-cell compartment of HIV-1 infected people, indicating excessive CTL activation and premature senescence. Here human telomerase RT (hTERT) transduction of HIV-1-specific CTL was used to study the functional impact of telomerase. Telomerase expression enhanced proliferative capacity, as well as cytolytic and antiviral capabilities; cytokine production was unchanged. hTERT transduced CTLs were 10-fold more efficient in controlling HIV-1 replication in culture. Thus telomerase transduction can restore CTL mediated cytotoxicity, and may have therapeutic potential.
- Three polyclonal CD8+ T-cell lines derived from an HIV-1, HLA A*0201 positive patient were used in this study, including one specific for this epitope. An IV9-specific monoclonal cell line, 68A62 was also generated.

- A polyepitope vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2.
- HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D^d – this transgene is the only MHC molecule expressed in the mice.
- CTL responses to Gag (77–85) SLYNTVATL, Pol (476–484) ILKEPVHGV, gp120 (120–128) KLTPLCVTL, and Nef (190–198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost.
- No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157–166 (PLTFGWCYKL), Pol 346–354 (VIYQYMDDL), and Nef 180–189 (VLEWRFD SRL)

- Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested.
- ILKEPVHGV was recognized by 2 of the patients.

Epitope ILKDPVHGV

Immunogen HIV-1 infection, HIV-1 exposed seronegative

Species (MHC) human (A2)

Keywords inter-clade comparisons, HIV exposed persistently seronegative (HEPS), immunodominance

References Kaul *et al.* 2001a

- Variants ILK(D/E)PVHGV are A/B clade specific.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-A2 women, 7/10 HEPS and 14/26 HIV-1 infected women recognized this epitope, and ILK(D/E)PVHGV tended to be more reactive in HEPS women, SL(F/Y)NTVATL in infected women.
- The dominant response to this HLA allele was to this epitope in all 7/10 HEPS cases but in only 5 of the 14/26 HIV-1 infected women.
- Four epitopes were considered to be “resistant epitopes”, as they were preferentially reactive in HEPS women and so may confer resistance, and these were found in three different proteins: A2 ILK(D/E)PVHGV in RT, A*6802 DTVLEDINL in Protease, B14 DLN(M/T)LN(I/V)V in p24 and B18 FRDYV-DRF(Y/F)K also in p24.

- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.
- Subject ML 1250 had an A2 response to ILK(D/E)PVHGV prior to seroconversion, which switched to SL(F/Y)NTVATL post-seroconversion.
- Subject ML 1760 had an A2 response to ILK(D/E)PVHGV prior to seroconversion, and gained responses to epitopes A2 SL(F/Y)NTVATL and B27 KRWII(L/M)GLNK post-seroconversion.

Donor MHC A2

Keywords epitope processing

References Cohen *et al.* 2002

- The antigen presentation of two A2-restricted epitopes was compared, SLYNTVATL (p17) and ILKEPVHGV (RT). HIV-1 infected cells were more sensitive to lysis by SLYNTVATL-specific CTL than by ILKEPVHGV-specific CTL, because of a higher density of SLYNTVATL-A2 resulting from differences in processing.
- Incubation with a T1-cell proteolytic extract showed that by four hours, 25% of a p17 peptide had a C-term Leu-85 and were SLYNTVATL-precursors, while ILKEPVHGV-precursors were far less frequent (6.8%) even with four times more proteolytic extract after 30 hours.
- p17 was preferentially cleaved between Leu85 and Tyr86, while appropriate Val484 and Tyr485 cleavage was minor for RT.
- In a competition experiment, RSLYNTVATL bound TAP 3.7-fold more efficiently than RT peptides.
- No difference in CTL avidity was detected in six patients with HLA-A2-restricted responses to these epitopes.
- No significant difference in HLA-A2 binding of to p17 or RT epitopes was observed.

Epitope name Pol476

Immunogen HIV-1 infection

Species (MHC) human (A2)

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay, Flow cytometric CTL assay

Keywords binding affinity, inter-clade comparisons, computational epitope prediction

References Corbet *et al.* 2003

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This epitope was one of the previously identified HLA-A2 epitopes studied.
- 9/17 HIV-infected HLA-A2+ people recognized this epitope.

HXB2 Location RT (309–317)

Epitope ILKEPVHGV

Epitope name RT2

Subtype B

Immunogen Vaccine, in vitro stimulation or selection
Vector/Type: peptide *HIV component:* RT
Adjuvant: Incomplete Freund's Adjuvant (IFA)

Species (MHC) transgenic mouse (A2)

References Domingo *et al.* 2003

- A virus-like protein scaffold, called E2DISP, derived from pyruvate dehydrogenase multienzyme from *Bacillus stearothermophilus* has been engineered to display 60 copies of one or more epitopes on a single molecule.
- The E2DISP scaffold displaying pep23 is able to stimulate a Th responses, and peptide RT2, which is a CTL epitope from HIV-1 RT, was able to elicit a CD8+ T cell response *in vitro* and in a vaccinated HLA-A2 transgenic mouse. Thus the E2DISP scaffold allows cell-entry and access to the class I and class II processing pathways.

Epitope ILKEPVHGV

Immunogen HIV-1 infection

Species (MHC) human (A2)

Assay type CD8 T-cell Elispot - IFN γ , Tetramer binding, Flow cytometric CTL assay

Keywords responses in children

References Sandberg *et al.* 2003

- 65 vertically HIV-1 infected children, ages 1–16, the majority undergoing ART, were analyzed in regard to their plasma viremia and CD4+ and CD8+ T cell counts, and CD8+ T cell responses.
- Using vaccinia expressed Gag, Pol, Env, Rev, Nef in target cells in an Elispot assay, 85% of the children recognized at least one HIV antigen. The strong CD8+ T cell responses were directed against Pol, followed by Gag and Nef. Children younger than 4 had significantly weaker responses (7/14 had no response) than older children (only 1/32 had no response, and responses were greater in magnitude).
- SLYNTVATL and ILKEPVHGV tetramers were used to quantitate specific responses. 49 children in an expanded cohort carried HLA-A2. 1/11 children under 3 years of age had detectable CD8+ T-cell responses to SLYNTVATL, 2/11 to ILKEPVHGV. Among children over 3, 11/38 recognized SLYNTVATL and 9/38 recognized ILKEPVHGV.
- Older children that maintained a CD4 count greater than 400 cells/ul tended to have stronger CTL responses.

Immunogen HIV-1 infection

Species (MHC) (A2)

Donor MHC A2, A3, B27, B51; A2, A3, B27, B57; A2, A23, B57

Assay type cytokine production, CD8 T-cell Elispot - IFN γ , Tetramer binding, Intracellular cytokine staining

Keywords assay standardization/improvement, memory cells

References Sun *et al.* 2003

- This study compares assay methods for testing CTL responses using samples from 20 HIV+ patients. The study compares ELISpot, tetramer-binding, and intracellular IFN γ . Tetramer-binding analysis was performed with Gag (SLYNTVATL) or Pol (ILKEPVHGV) tetramers. Antigen presentation using recombinant vaccinia viruses (rVVs) encoding HIV-LAI Gag, Pol, Env, Nef, Tat and Vif proteins was compared to peptide panels. HIV antigen recognition in memory CTLs was measured by chromium release assay and compared to effector/memory CD8+ T cells in an IFN- γ ELISpot assay.
- Results: IFN γ Elispot and flow cytometry gave similar frequencies of HIV specific CD8+ T cells. Tetramer-binding analysis was most sensitive. Pools of peptides and the sum of frequencies of individual peptides were comparable. Elispot assays using peptides were more sensitive than assays using vaccinia expressed proteins. Cr release and Elispot against rVVs gave comparable memory cell responses 2/3s of the time.
- 3/7 HLA-A2+ patients recognized this epitope.

Author Location RT (309–317 NL43)

Epitope ILKEPVHGV

Epitope name IV9

Subtype B**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Assay type** Chromium-release assay, CTL suppression of replication**Keywords** escape**References** Yang *et al.* 2003a

- Virus was cultured in the presence of CTL lines specific for 4 different epitopes (SLYNTVATL, ILKEPVHGV, IEIKDTKEAL, and KEKGGLEGL) to study the emergence of escape mutations. Escape varied between clones for the same epitope, and between different epitopes. Gag and RT epitope escape, if it occurred at all, tended to be monoclonal and within the epitope, indicating strong fitness constraints, while the Nef epitope escape was rapid, polyclonal, and sometimes the result of upstream frameshifts.
- There was one cloned cell line that recognized ILKEPVHGV, 68A62. After 2 weeks of passaging HIV-1 in the presence of 68A62, the mutated epitope ilkeLvghv was found in 6/12 sequences.

HXB2 Location RT (309–317)**Author Location** Pol**Epitope** ILKEPVHGV**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Country** Netherlands.**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** HIV exposed persistently seronegative (HEPS)**References** Koning *et al.* 2004

- A high-risk seronegative group of 29 homosexual men showed reduced cellular in vitro susceptibility for HIV infection and enhanced production of RANTES compared to 15 men who went on to seroconvert. Significantly higher frequencies of HLA A*11, A*31 and Cw*15 were also found in the high risk seronegative men. Both groups of men had low frequencies of HIV-1 specific CD8+ T-cells, which may signify exposure more than protection from infection.
- 2/11 HLA A2+ infection-resistant men, compared to 1/9 pre-seroconversion men who went on to become infected, reacted to this epitope.

HXB2 Location RT (309–317)**Author Location** RT Pol (464–472)**Epitope** ILKEPVHGV**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Country** Spain.**Assay type** proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric CTL assay**Keywords** HAART, ART, supervised treatment interruptions (STI), immune dysfunction**References** Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load.

- 9/19 patients recognized this epitope.

HXB2 Location RT (309–317)**Author Location** RT (309–317)**Epitope** ILKEPVHGV**Epitope name** RT-IV9**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Assay type** Chromium-release assay**Keywords** binding affinity, TCR usage, characterizing CD8+ T cell responses**References** Yang *et al.* 2003b

- Killing efficiency of CTLs and their ability to suppress viral replication is shown to depend more on epitope specificity than to antigenic avidity. Different clones recognizing the same epitope had similar killing efficiency despite their variation in avidity. Nef specific CTL clones tended to be most inhibitory, followed by Gag, then by RT specific clones, regardless of avidity.
- 2/14 CTL T-cell clones tested were specific for RT/IV9. Under conditions of excess peptide (100 μ g/ml), there was no difference in their lytic potential; all possessed similar effector capacity. Avidity was measured as the sensitizing dose of peptide required for 50% of maximal killing (SD50), which varied from 20 pg/ml to 100 ng/ml, over four orders of magnitude for all 14 epitopes. The SD50 values for the two RT/IV9 clones were very different, 50 and 20,000 pg/ml.

HXB2 Location RT (309–317)**Author Location** (B consensus)**Epitope** ILKEPVHGV**Epitope name** IV9**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Donor MHC** A02, A03, B08, B62, Cw7, Cw10**Country** United States.**Assay type** cytokine production, Intracellular cytokine staining, Chromium-release assay, Flow cytometric CTL assay**Keywords** assay standardization/improvement, memory cells, characterizing CD8+ T cell responses**References** Lichterfeld *et al.* 2004c

- Using a flow-cytometric cytotoxicity assay based on caspase-3 activation in dying target cells, it was shown that the subset of HIV-1-specific CD8+ T-cells secreting both IFN-gamma and TNF-alpha exhibit stronger cytotoxic activity than those secreting only IFN-gamma. These cells also exhibited stronger intracellular perforin expression. No association between HIV-1-specific CD8+ T-cell maturation phenotypes and intracellular perforin expression was found.
- 1/9 individuals recognized this epitope.

HXB2 Location RT (309–317)**Author Location** RT (309–317)**Epitope** ILKEPVHGV**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Assay type** Chromium-release assay

Keywords assay standardization/improvement

References Lubong *et al.* 2004

- Using IL7 or IL15 in culturing of HIV-1 specific CTL clones was inferior to using IL-2 alone and the addition of these cytokines to IL-2 did not show any advantage. Neither proliferation, survival or lytic capacity of HIV-1-specific CTLs was significantly enhanced by addition of IL7 or IL15.

HXB2 Location RT (309–317)

Epitope ILKEPVHGV

Immunogen HIV-1 exposed seronegative

Species (MHC) human (A2)

Donor MHC A02, A30, B4402, B15

Assay type Tetramer binding, T-cell Elispot

Keywords HIV exposed persistently seronegative (HEPS)

References Missale *et al.* 2004

- HIV-specific T-cell response was tested in HIV-uninfected patients exposed to blood from a patient with highly replicating HIV; these same patients were nosocomially infected with HBV. HIV-specific T-cell responses were directed to structural and non-structural HIV proteins in two patients suggesting that the virus replicated in these patients sufficiently to prime a cell-mediated immune response that protected these individuals from HIV infection.
- This patient responded to 4/8 HIV epitopes tested in an IFN γ EliSpot assay or tetramer assay. Responses were detected 8 and 28 weeks after exposure. A response to ILKEPVHGV was detected by both assays.

HXB2 Location RT (309–317)

Author Location Pol

Epitope ILKEPVHGV

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A2)

Country United Kingdom.

Assay type Tetramer binding, T-cell Elispot, Intracellular cytokine staining

Keywords rate of progression, acute infection, characterizing CD8+ T cell responses, immune dysfunction

References Papagno *et al.* 2004

- Acute HIV-1 infection induces massive activation of HIV-specific and non-HIV-specific CD8+ T-cells resulting in differentiation of these cells. High differentiation of CD8+ T-cells is correlated with disease progression. Differentiation is a natural process but it can be driven by elevated immune activation, such as in HIV infection.

HXB2 Location RT (309–317)

Author Location (309–317)

Epitope ILKEPVHGV

Epitope name RT2

Immunogen Vaccine

Vector/Type: bacteriophage coat protein, dihydrolipoyl acetyltransferase E2 protein, of *Bacillus stearothermophilus* HIV component: RT

Species (MHC) transgenic mouse (A2)

Assay type Chromium-release assay

Keywords vaccine antigen design

References De Berardinis *et al.* 2003

- An RT T-helper (KDSWTVNDIQLKLVGK) that can be promiscuously presented by multiple HLA-DR molecules, and an RT CTL epitope (ILKEPVHGV) presented by HLA-A2, were displayed using two different antigen presentation systems, bacteriophage virions or E2 protein scaffolds. Both systems enabled display of the epitopes in a mouse model system to the immune system. CTL responses were detected in immunized mice, and were processed correctly for both class I and class II presentation.

HXB2 Location RT (309–317)

Epitope ILKEPVHGV

Immunogen HIV-1 infection

Species (MHC) human (A2 supertype)

Keywords supertype, rate of progression

References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind three of the five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802).

Epitope name LR22

Subtype B

Immunogen Vaccine

Vector/Type: peptide *Strain:* B clade LAI
Adjuvant: Incomplete Freund's Adjuvant (IFA), Montanide (ISA 720), P30, PLG

Species (MHC) mouse (A2.1)

Keywords binding affinity, vaccine-specific epitope characteristics, immunodominance

References Peter *et al.* 2001

- The stability of peptide binding to HLA-A2.1 was determined for six HLA-A2.1 peptides included in this vaccine study – ILKEPVHGV (RT), SLYNTVATL (p17), SLLNATDIAV (gp41) and LLWKGEAV (RT) all bound with high affinity comparable to a influenza epitope reference (GILGFVFTL), while RGPGRFVTI and VIYQYMDDL bound with a lower affinity (relative binding activity = 0.01).
- The four high-affinity peptides formed stable complexes with half-lives ranging between 8 and 32 hours, while the low affinity peptides had half lives of less than an hour.
- HLA-A2.1 transgenic mice were immunized with the six HIV-1 peptides and P30, as a universal T-helper epitope, with IFA or Montanide or microspheres as adjuvants.
- All peptides except VIYQYMDDL induced a strong CTL response in Cr-release assays - stronger responses were observed when peptides were delivered alone, indicating immunodominance when the combination was used.

Epitope ILKEPVHGV

Epitope name LR22

Subtype B

Immunogen Vaccine

Vector/Type: peptide *Strain:* B clade LAI
Adjuvant: Incomplete Freund's Adjuvant (IFA), IL-12, P30

Species (MHC) mouse (A2.1)

Keywords vaccine-specific epitope characteristics, immunodominance

References Peter *et al.* 2002

- When HIV-1 peptides were used to vaccinate HLA-A2.1 transgenic A2-Kb mice, strong responses to five peptides were observed when the peptides were given individually, but immunodominance limited the response to some of the peptides when they were given in combination Peter *et al.* [2001]. IL-12 can counteract immunodominance in BALB/c mice, so it was given with the multiple epitope vaccination, and was instead found to specifically eliminate the HLA-A2.1-epitope CTL responses, but not Kb CTL responses. This was possibly a consequence of transient depletion of T-cells, B cells and macrophages in the spleen.

Epitope name A3-RK11

Subtype B

Immunogen HIV-1 infection
Species (MHC) human (A3)

Donor MHC A3, B7, Cw7

Keywords dynamics, supervised treatment interruptions (STI), acute infection

References Yu *et al.* 2002a

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- 0/14 HLA-A3 positive individuals had detectable A3-restricted responses to this epitope during acute infection, but only 5/15 of HLA-A3 epitopes tested were targeted during acute infection. 5/7 individuals began to have detectable responses to this epitope after STI.

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
 - 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2–42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
 - A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
 - The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
 - Responses to this peptide were detected in 21% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Assay type CD8 T-cell Elispot - IFN γ

Keywords cross-presentation by different HLA, characterizing CD8+ T cell responses

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.

- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.

- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient A displayed the greatest response to epitope B14-EL9(gp41), a strong response to B7-TL9(p24), and responses to B7-TM9(Nef) and A32-PW10(RT). Patient B displayed the greatest response to epitope B44-AW11(p24) and also responded to A32-PW10(RT) in both PB and LN samples, while a third response against epitope A32-RW10(gp120) was only detected in the LN sample. Patient D displayed the greatest response to B27-KK10 (p24), and also responded to A30-RY11(p17), A32-PW10(RT), A30-KY11(RT), A32-RW10(gp120), and B18-YY9(Nef).

Keywords HIV exposed persistently seronegative (HEPS)

References Koning *et al.* 2004

- A high-risk seronegative group of 29 homosexual men showed reduced cellular in vitro susceptibility for HIV infection and enhanced production of RANTES compared to 15 men who went on to seroconvert. Significantly higher frequencies of HLA A*11, A*31 and Cw*15 were also found in the high risk seronegative men. Both groups of men had low frequencies of HIV-1 specific CD8+ T-cells, which may signify exposure more than protection from infection.
- No one, 0/3 HLA B35+ infection-resistant men, and 0/5 pre-seroconversion men who went on to become infected, reacted to this epitope.

HXB2 Location RT (432–440)

Author Location RT (587–596 SF2)

Epitope EPIVGAETF

Immunogen HIV-1 infection

Species (MHC) human (B35, B51)

References Shiga *et al.* 1996

- Binds HLA-B*3501, and is also presented by B51 – but CTL could not kill RT-vaccinia virus infected cells that expressed B51.

HXB2 Location RT (432–440)

Author Location Pol (587–595)

Epitope EPIVGAETF

Immunogen HIV-1 infection

Species (MHC) human (B35, B51)

References Ferrari *et al.* 2000

- One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.

HXB2 Location RT (432–440)

Author Location RT (432–440)

Epitope EPIVGAETF

Immunogen HIV-1 infection

Species (MHC) human (B51)

Donor MHC A03, A32, B51, B15, Cw03, Cw06, DR4, DR8, DQ7

Country Netherlands.

Assay type CD8 T-cell Elispot - IFN γ , Flow cytometric CTL assay

Keywords rate of progression, escape

References Geels *et al.* 2003

- Both stable potential epitopes and epitopes with escape mutations were found in a patient with increasing viral load over a time period of 4 years. Fixation of escape mutations occurred sequentially and correlated with the rise in viral load and with the increased number of productively infected cells.
- This is one of 17 potential epitopes from this individual, defined based on previously identified epitopes presented by appropriate HLA molecules. Full length genome sequence did not reveal changes in time in any of these epitopes over a four year period. Peptide pools initially revealed very little response to these epitopes, but this increased over time.

HXB2 Location RT (432–441)**Author Location** Pol (587–596)**Epitope** EPIVGAETFY**Immunogen** HIV-1 infection**Species (MHC)** human (B*3501)**References** Tomiyama *et al.* 2000a

- CD8+ T-cells that bound one of six HIV-specific B*3501-epitope tetramers did not express CD28 or CD45A.
- A significant increase in CD28-CD45RA- cells and a decrease of CD28+CD45RA+ cells was observed in chronically HIV-1-infected individuals relative to healthy individuals.
- CD28-CD45RA- cells are likely to be effector cells and have high levels of perforin in their cytoplasm.
- The mean percentage of total CD28- CD8+ cells in chronically infected HIV-1-infected patients was 76.6% in comparison to HIV-1-uninfected individuals (40.6%)

Epitope QIIEQLIKK

Subtype B, CRF01_AE

Immunogen HIV-1 infection

Species (MHC) human (A*1101)

Keywords inter-clade comparisons, TCR usage

References Fukada *et al.* 2002

- Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A-E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals.
- QIIEQLIKK was found to elicit clade-specific responses in clade B (QIIEQLIKK is most common) and clade E (qiieElikk is most common). QIIEQLIKK was strongly recognized by CTL from 1/5 B clade infected Japanese subjects, and qiieElikk from 3/7 E clade infected Thai subjects. The variant qiieKliEk, common in the A subtype, was also recognized in 2/7 E clade infected Thai subjects.
- The binding of QIIEQLIKK, qiieElikk and qiieKliEk to HLA A*1101 was similar, but CTL clones from individuals did not cross-react with the cross-clade peptides indicating that the substitutions inhibited TCR interaction.

An average of 4 epitopes were recognized per patient.
- This peptide was an intermediate A2 binder, and induced a CD8+ T-cell IFN gamma response in 1/6 mice. Responses were detected in 1/17 HIV+ HLA-A2 subjects.

HXB2 Location RT (532–540)

Author Location Pol (714–722)

Epitope YLAWVPAHK

Immunogen HIV-1 infection

Species (MHC) human (A3 supertype)

Keywords supertype, rate of progression

References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind 5/5 HLA-A3 supertype alleles (A*0301, A*1101, A*3101, A*3301 and A*6801).

HXB2 Location RT (532–540)

Author Location RT (532–540)

Epitope YLAWVPAHK

Immunogen HIV-1 infection

Species (MHC) human (B7)

References Haas *et al.* 1998

- Of 98 patients in cross-sectional analysis, 78% had CTL against pol – RT was more immunogenic than Integrase and Protease (81%, 51%, and 24% of 37 patients, respectively)
- New clusters of epitopes were defined utilizing different HLA molecules.
- This epitope occurs in the p15 (RNase) domain of Pol p66 RT.

HXB2 Location RT (532–540)

Author Location RT Pol (687–695)

Epitope YLAWVPAHK

Immunogen HIV-1 infection

Species (MHC) human (B7)

Country Spain.

Assay type proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric CTL assay

Keywords HAART, ART, supervised treatment interruptions (STI), immune dysfunction

References Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load.
- 3/7 patients recognized this epitope.

Author Location (C consensus)

Epitope LPPIVAKEI

Subtype C

Immunogen HIV-1 infection

Species (MHC) human (B*4201)

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cell responses

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location Integrase (28–36)

Author Location Pol (743–751 SF2)

Epitope LPPVVAKEI

Immunogen HIV-1 infection

Species (MHC) human (B*5101)

Keywords inter-clade comparisons, rate of progression

References Tomiyama *et al.* 1999

- HLA-B27, -B51, and -B57 are associated with slow progression to AIDS, while HLA-B35, -B8, -B24 are associated with a rapid progression to AIDS (Nat. Med. 2:405, 1996; Lancet 22:1187, 1986; Hum Immunol 22:73, 1988; Hum Immunol 44:156, 1995)
- 15% of Japanese populations carry HLA-B51 while HLA-B27 and -B57 are detected in less than 0.3%
- Of the 172 HIV-1 peptides with HLA-B*5101 anchor residues, 33 bound to HLA-B*5101, seven of these peptides were reactive with CTL from 3 B*5101 positive individuals, and six were properly processed.
- Four of the six epitopes were highly conserved among B subtype sequences – LPPVVAKEI is highly conserved.

Epitope ETAYFILKL

Immunogen HIV-1 infection, HIV-1 exposed seronegative

Species (MHC) human (A*6802)

Keywords HIV exposed persistently seronegative (HEPS), immunodominance

References Kaul *et al.* 2001a

- ETAYFILKL cross-reacts with clades A, B and D.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-A*6802 women, 3/12 HEPS and 9/11 HIV-1 infected women recognized this epitope likelihood ratio 7.9, p value 0.01, and HEPS women tended to respond to DTVLEDINL, while infected women to ETAYFILKL.
- The dominant response to this HLA allele was to this epitope in 2 of the 3/12 HEPS cases and in all 9/11 HIV-1 infected women that responded to the epitope.

- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.
- Subject ML 1203 started with CTL responses to A*6802 DTVLEDINL and to B7 FPVTPQVPLR prior to seroconversion, and upon seroconversion acquired additional responses to A*6802 ETAYFILKL which became dominant, B7 TPGPG(V/I)RYPL, B7 IPRRIRQGL, and B7 SPRTLNAWV.
- Subject ML 1707 started with a CTL response to A*6802 DTVLEDINL prior to seroconversion, and switched to A*6802 ETAYFILKL and A24 RDYVDRFFKTL post-seroconversion.
- Subject ML 1830 made no detectable response prior to seroconversion, but responded to A*6802 DTVLEDINL and A*6802 ETAYFILKL post-seroconversion.

Assay type CD8 T-cell Elispot - IFN γ
Keywords characterizing CD8+ T cell responses
References Kiepiela *et al.* 2004
- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
 - This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Keywords supervised treatment interruptions (STI), immunodominance, early treatment

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2–42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 21% of the study subjects, and it was one of the 25 most frequently recognized peptides.

- Protease and Integrase are shown to be frequently targeted by CD8 T-cell responses (23% and 68% of 56 HIV+ patients, respectively). Responses tend to cluster in conserved regions of Integrase, although one high conserved region had no responses. CTL frequencies per unit protein length for Protease and Integrase were similar to other HIV non-structural proteins. Three novel, HLA class I-restricted optimal epitopes were found and characterized with fine mapping.

HXB2 Location Integrase (219–228)**Author Location** Pol (934–943 SF2)**Epitope** KIQNFRVYYR**Subtype** B**Immunogen** HIV-1 infection, computer prediction**Species (MHC)** human (A*3303)**Assay type** Chromium-release assay**Keywords** binding affinity, computational epitope prediction**References** Hossain *et al.* 2003

- HLA-A*3303 is a common HLA allele in east and southeast Asia. Pol, Gag and Nef SF2 proteins were scanned for potential A*3303 epitopes. 99 potential epitopes were synthesized, and 52/99 bound to A*3303. Six of these served as peptide-targets for lysis by PBMC from infected individual, and clones derived from 4 of these 6 could lyse HIV-vaccinia infected target cells, indicating proper processing.
- This epitope is one of the 4 that are properly processed.

HXB2 Location Integrase (219–228)**Author Location** Pol (919–928)**Epitope** KIQNFRVYYR**Immunogen** HIV-1 infection**Species (MHC)** human (A3 supertype)**Keywords** supertype, rate of progression**References** Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind 5/5 HLA-A3 supertype alleles (A*0301, A*1101, A*3101, A*3301 and A*6801).

Keywords vaccine-specific epitope characteristics, immunodominance
References Peter *et al.* 2002
 • When HIV-1 peptides were used to vaccinate HLA-A2.1 transgenic A2-Kb mice, strong responses to five peptides were observed when the peptides were given individually, but immunodominance limited the response to some of the peptides when they were given in combination Peter *et al.* [2001]. IL-12 can counteract immunodominance in BALB/c mice, so it was given with the multiple epitope vaccination, and was instead found to specifically eliminate the HLA-A2.1-epitope CTL responses, but not Kb CTL responses. This was possibly a consequence of transient depletion of T-cells, B cells and macrophages in the spleen.

Keywords binding affinity, acute infection, early-expressed proteins
References Cao *et al.* 2003
 • All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope.

The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.

- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Keywords review, HIV exposed persistently seronegative (HEPS)

References Rowland-Jones *et al.* 2001

- This is a review that summarizes observations about HIV-specific CTL found in the HIV-1 exposed persistently seronegative (HEPS) population.
- The CTL responses assayed by ELISPOT and by CTL precursor frequencies by limiting dilution analysis indicate that CTL in HEPS individuals tend to be of a lower magnitude than in chronic HIV-1 infections – the responses in HEPS cases are below the level of detection by tetramer assays.
- CD8+ CTL responses tend to be detectable in HEPS subjects only if they are recently exposed, and the response diminishes if exposure is reduced – it is not clear if there is a stable memory population in HEPS cases.
- CD8+ CTL responses in the HEPS population are associated with HIV-1 specific CD4+ T cell responses, assayed by proliferation assays, IL-2 secretion, and ELISPOT, and the authors consider the possibility that HIV-1-specific T-help responses improve the "quality" of the CD8+ response in HEPS individuals relative to HIV-1 infected individuals, who tend to have a poor HIV-1-specific T-help response.
- HIV-1 specific CD8+ CTL responses in HIV-1 infected individuals show reduced levels of perforin, and the T cells may not mature properly, and although similar studies have not been conducted in HEPS individuals this is considered as a possible difference in the CTL immune response in HEPS and HIV-1 infected people.

References Kuhn *et al.* 2002; Wasik *et al.* 1999

- In HIV-infected infants HIV-specific, CTL responses were not detectable in cord blood or in PBMC collected shortly after birth and were absent or remained very low in 3 infants with a rapidly progressive disease. For those who progressed more slowly, the HIV-specific CTL activity varied.

- The two infants with high levels of Env peptide-stimulated IL-2 responses had the highest CTLp frequencies.
- Stronger responses were detected after initiation of the antiretroviral therapy.
- Two babies that were not infected though born to HIV+ mothers had detectable though low HIV-specific CTLp responses to Env (1/2), Pol (2/2), Gag (1/2) cord blood and transiently in PBMC after birth.
- Reviewed in Kuhn *et al.* [2002].

Keywords epitope processing, escape

References Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found highly variable regions found in Nef, Env and p17.
- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed, however, epitopes were not found that span the invariant, most highly conserved regions of RT and Protease. This might be due to the virus evolving conserved features that disallow the CTL responses in these most conserved regions, as functional constraints for enzyme function would not tolerate change and normal capacity for immune escape by rapid evolution is lost in these domains.

Subtype B

Immunogen HIV-1 and HCV co-infection

Species (MHC) human

Keywords rate of progression

References Lauer *et al.* 2002

- HIV-1 and HCV immune responses were studied in 22 individuals who were co-infected with HIV-1 and hepatitis C virus (HCV). IFNgamma production was measured in an Elispot assay of CD8+ T-cells using targets expressing either Gag, RT, Env and Nef in a vaccinia construct, or one of seven HCV proteins.
- All 22 patients targeted at least one protein. 20/22 patients recognized RT, 17/22 patients recognized Gag, 13/22 subjects recognized Env and 11/22 patients recognized Nef. Robust CTL activity was independent of disease progression or viral load.
- Despite high HCV viral loads, very few HCV CD8+ T-cell Elispot responses were detected. In a control HCV infected person who did not have HIV-1, strong anti-HCV responses were mounted.
- HIV-specific CD4 proliferative responses were detected in 9/17 coinfecting patients, but no HCV responses were detected.

- Dendritic cells acquire and present HIV-1 antigens derived from dead, apoptotic cells or from non-infectious, fusion-competent HIV-1 virions, and these DC cells could stimulate CD4+ and CD8+ T-cells resulting in IFN γ production in an Elispot assay. Both HLA Class I and class II molecules were used for presentation. This may be an important aspect of the initial immune response to HIV-1 infection of CD4+ cells in the mucosal subepithelia.

HXB2 Location Pol**Author Location** (IIIB)**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART, supervised treatment interruptions (STI)**References** Ortiz *et al.* 2001

- Immune responses in eight chronically HIV-1 infected patients undergoing HAART therapy structured treatment interruptions (STI) were studied. STI boosted HIV-1 specific CTL responses and elevated CTL responses were maintained up to 22 weeks after the last treatment interruption, but viral load rebound to pretreatment levels and CD4 T-cell count decline was observed. CD8 responses in PBMC were measured by cytokine flow cytometry with gp160, Gag p55, RT-Pol and Nef expressed in vaccinia.

HXB2 Location Pol**Author Location****Epitope****Immunogen** computer prediction**Species (MHC)** (A*0201, B*3501)**Keywords** inter-clade comparisons, computational epitope prediction**References** Schönbach *et al.* 2002

- Computational methods (artificial neural networks, hidden Markov models, binding matrices based on HLA association rates) were used to identify HLA-A*0201 and HLA-B*3501 HIV T-cell epitope candidates from 533 Gag, Env and Pol sequences of which 374 were derived from HIV-1, 97 were derived from HIV-2 and 62 from SIV. Comparisons to known epitopes and between clades were made.

HXB2 Location Pol**Author Location** Pol**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human (A*0201, Cw*08)**References** Shacklett *et al.* 2000

- HIV-1 specific, MHC class I-restricted CTL killing was detected in duodenal and rectal gut associated lymphoid tissue (GALT) sites from three infected individuals – the distribution of class I restricted CTL was different in the peripheral blood samples and GALT samples.

HXB2 Location Pol**Author Location** RT (IIIB)**Epitope****Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Keywords** epitope processing, escape**References** Moore *et al.* 2002b

- HIV polymorphisms in the RT protein were examined relation to HLA alleles found in a population of 473 participants in the Western Australian HIV Cohort Study. 64 significant associations between polymorphisms at particular positions and HLA alleles were detected, for HLA-B7, -B12, -B35 and -B15. Fifteen of these were in positions with known epitopes, 4 in anchor residues, 11 in other positions. Six additional polymorphic sites associated with particular HLA molecules flanked known epitopes and may relate to processing.
- 25 negative associations were also found between polymorphism and HLA alleles. The authors propose this is due to escape mutations in epitopes presented by common HLA types dominating in the population, and give examples of five amino acids which are in the consensus and tend to be stable in those with the most common HLA allele, HLA-A2.

HXB2 Location Pol**Author Location** Pol**Epitope****Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B*35)**Keywords** rate of progression**References** Jin *et al.* 2002

- Patients with HLA-B*35 variants B*3502, B*3503, B*3504, and B*5301 tend to proceed to AIDS more quickly than those with B*3501.
- Of 32 patients with HLA-B*35 alleles CD8+ CTL responses were quantified using an intracellular cytokine staining assay – 75% had responses to Pol, 69% to Gag, 50% to Nef, and 41% to Env.
- The overall magnitude of CTL responses did not differ between those bearing B*3501 and the others. A higher percentage of Gag responses was observed in those that had lower RNA levels that carried B*3501, and there was a negative association with viral load and CTL activity. The data is consistent with higher levels of CTL responses contributing to protection in B*3501 individuals, but not in B*3502, B*3503, B*3504, and B*5301 individuals.

Keywords epitope processing, escape

References Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found highly variable regions found in Nef, Env and p17.
- While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.
- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.
- What was learned from proteins where many epitopes have been defined (Gag, Pol, Env and Nef) was used to develop an algorithm to predict where epitopes would be localized in Rev, Tat, Vif, and Vpr. Predictions were made blinded, and then compared to the first 15 epitopes defined in these proteins; the epitopes were concentrated in the predicted regions.

Species (MHC) human (B*0702)
Keywords optimal epitope
References Frahm *et al.* 2004

HXB2 Location Vif (48–57)
Author Location (C consensus)
Epitope HPKVSSEVHI
Subtype C
Immunogen HIV-1 infection
Species (MHC) human (B*4201)
Country South Africa.
Assay type CD8 T-cell Elispot - IFN γ
Keywords characterizing CD8+ T cell responses
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location Vif (48–57)

Author Location Vif (48–57)
Epitope HPRVSSEVHI
Epitope name B7-HI10
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B7)
Donor MHC A3, B7, Cw7
Keywords dynamics, supervised treatment interruptions (STI), acute infection

References Yu *et al.* 2002a

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- 0/11 HLA-B7 individuals had detectable B7-restricted responses to this epitope during acute infection – 10/15 of HLA-B7 epitopes tested were targeted by at least one person during acute infection. 2/4 individuals had detectable responses to this epitope after STI.

References Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found highly variable regions found in Nef, Env and p17.
- While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.
- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.
- What was learned from proteins where many epitopes have been defined (Gag, Pol, Env and Nef) was used to develop an algorithm to predict where epitopes would be localized in Rev, Tat, Vif, and Vpr. Predictions were made blinded, and then compared to the first 15 epitopes defined in these proteins; the epitopes were concentrated in the predicted regions.

Assay type CD8 T-cell Elispot - IFN γ

Keywords binding affinity, acute infection, early-expressed proteins

References Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15–92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

Assay type T-cell Elispot

Keywords supervised treatment interruptions (STI), immunodominance, early treatment

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2–42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.

- Responses to this peptide were detected in 17% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Keywords binding affinity, acute infection, early-expressed proteins

References Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15–92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN- γ secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

Keywords epitope processing, escape

References Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found in highly variable regions found in Nef, Env and p17.

- While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.
- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.
- What was learned from proteins where many epitopes have been defined (Gag, Pol, Env and Nef) was used to develop an algorithm to predict where epitopes would be localized in Rev, Tat, Vif, and Vpr. Predictions were made blindly, and then compared to the first 15 epitopes defined in these proteins; the epitopes were concentrated in the predicted regions.

Country South Africa.
Assay type CD8 T-cell Elispot - IFN γ
Keywords cross-presentation by different HLA, characterizing CD8+ T cell responses
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location Vpr (34–42)

- HIV was scanned for all peptides which carried the A2-super motif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested.
- Three additional previously described HLA-A2 epitopes were added to the set of 20, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2)
- This epitope binds to three HLA-A2 supertype alleles: A*0202, A*6802 (strongest affinity) and A*0203.
- 3/22 chronically infected patients had a weak ELISPOT response to this epitope.
- 0/12 HLA-A2 patients with acute HIV-1 infection responded to this peptide.

HXB2 Location Vpr (62–70)

Author Location Vpr (62–70)**Epitope** RILQQLLFI**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A*0201)**Keywords** early-expressed proteins**References** Addo *et al.* 2002b

- CTL responses against regulatory and accessory proteins in 70 HIV-1 infected patients were studied using overlapping peptides and Elispot.
- 28% targeted one or more overlapping Tat peptides; 36%, Rev peptides; 33%, Vif peptides; 40%, Vpr peptides; and 2%, Vpu peptides.
- All known optimally defined epitopes were summarized for the five proteins.

HXB2 Location Vpr (62–70)**Author Location** Vpr**Epitope** RILQQLLFI**Epitope name** Vpr 62**Subtype** M**Immunogen** Vaccine, in vitro stimulation or selection*Vector/Type:* DNA, peptide *Adjuvant:* Incomplete Freund's Adjuvant (IFA)**Species (MHC)** human, mouse, humanized mouse (A*0201)**Assay type** cytokine production, T-cell Elispot**Keywords** inter-clade comparisons, computational epitope prediction, escape, TCR usage, variant cross-recognition or cross-neutralization**References** McKinney *et al.* 2004

- This study examined variant recognition of epitopes presented by A*0201 and A*1101. Numerous amino acid substitutions can be introduced into epitopes without disrupting their recognition by CTLs, although epitopes with multiple substitutions were less recognized. An algorithm was constructed for prediction of epitopes capable of inducing responses to a great number of variant epitopes.
- A total of 23 variant forms of Vpr 62 were identified. More than 95% of the variant epitopes were recognized by CTLs from mice immunized with the parental form.
- Vpr 62 epitope (parent or variant form) was present in 96% of HIV sequences of many M group subtypes.

HXB2 Location Vpr (62–70)**Author Location** Vpr (62–70)**Epitope** RILQQLLFI**Immunogen** HIV-1 infection**Species (MHC)** human (A2 supertype)**Keywords** supertype, rate of progression**References** Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNP.

- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNP to clear virus.
- This epitope can bind three of the five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802).

HXB2 Location Vpr**Author Location****Epitope****Immunogen** Vaccine*Vector/Type:* adenovirus *HIV component:* Gag-Pol, Nef, Vpr**Species (MHC)** mouse**References** Muthumani *et al.* 2002

- Vpr can cause cells to go into G2 arrest, and it suppresses immune cell activation and inflammatory cytokine production, so co-immunization of BALB/c mice with recombinant adenovirus expressing Vpr and HIV-1 antigens Nef or Gag/Pol was tested to see if Vpr reduced the immune response to the other HIV antigens.
- Vpr compromised CD8+ T-cell lytic responses and T-helper proliferative responses in mice co-immunized with Vpr and Nef or Gag/Pol.
- In vitro, Vpr reduced T-cell cytokine production of IL-12 and TNFalpha, indicative of Vpr-mediated immune suppression.

II-B-16 Tat CTL, CD8+, epitopes

HXB2 Location Tat (2–11)**Author Location****Epitope** WPVDPRLPEPW**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** epitope processing, escape**References** Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found highly variable regions found in Nef, Env and p17.
- While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.
- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.
- What was learned from proteins where many epitopes have been defined (Gag, Pol, Env and Nef) was used to develop an algorithm to predict where epitopes would be localized in Rev, Tat, Vif, and Vpr. Predictions were made blindly, and then

compared to the first 15 epitopes defined in these proteins; the epitopes were concentrated in the predicted regions.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cell responses

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Assay type Chromium-release assay, Flow cytometric CTL assay

Keywords class I down-regulation by Nef

References Bobbitt *et al.* 2003

- Nef, through Nef-mediated MHC-I down-regulation, is not the only viral protein to influence levels of HIV-specific CTL recognition. The Rev L60F mutation, a common natural variant, can decrease CTL recognition of late gene products. The Rev mutation impacts the early to late gene switch, reducing late gene product production (Gag, Pol, Env, Vpu, Vpr and Vif), while increasing Nef production, both of which reduce the impact CTL recognition of late gene products. As expected, Rev L60F rendered HIV infected cells more resistant to CTL that recognized epitopes from the late proteins Env and Gag. Gag expression is reduced more than Env, and Gag-specific CTL were more profoundly affected. Conversely CTL against an epitope in an early gene product, Tat, were more efficiently recognized when infected with viruses carrying the Rev L60F mutation.
- Patients in the asymptomatic phase with active immune responses had more CTL resistant viruses, with lower Rev activity, lower Gag expression and greater resistance to Gag-specific CTL killing, while viruses isolated from people with AIDS were more sensitive to CTL killing.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cell responses

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay
Keywords dynamics, epitope processing, immunodominance, escape, acute infection, kinetics, characterizing CD8+ T cell responses, reversion, viral fitness
References Jones *et al.* 2004
- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
 - The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
 - Only four epitopes were found to acquire escape mutations in SUMA over time. Early in infection, three overlapping epitopes in Tat carried mutations: FHCQVCFMTK, VCFMTKGLGI, and MTKGLGISY. An M->T substitution was evident during acute infection in the first sample, at four days of the onset of symptoms, and a rare second variant was seen at day 20 that added a K->E substitution. The M->T substitution abrogated responses to FHCQVCFtTK, VCFtTKGLGI, but not in the third epitope tTKGLGISY. By day 69 a double mutation was evident that persisted through day 435, F->L and T->K. Variants IHCQVCFMkK, VCFMkKGLGI were not recognized, but the CTL response was strong to MkKGLGISY. The authors provide evidence that the F->L and T->K substitutions impact processing of the MTKGLGISY epitope, as the mutations don't abrogate a CTL response to the peptide, but Tat expressed in target cells doesn't allow recognition of the Tat variant.
 - MTKGLGISY was the highest level response in acute and early infection.

Assay type CD8 T-cell Elispot - IFN γ , CD4 T-cell Elispot - IFN γ
Keywords rate of progression, escape
References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0-80% as efficiently as the index peptide, and the relatively efficiency of the variant epitopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This was one of 8 reactive epitopes found not to vary over time.

Epitope TKALGISYGR
Subtype B

- Immunogen** HIV-1 infection
Species (MHC) human
Keywords epitope processing, escape
References Yusim *et al.* 2002
- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found highly variable regions found in Nef, Env and p17.
 - While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.
 - In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.
 - What was learned from proteins where many epitopes have been defined (Gag, Pol, Env and Nef) was used to develop an algorithm to predict where epitopes would be localized in Rev, Tat, Vif, and Vpr. Predictions were made blinded, and then compared to the first 15 epitopes defined in these proteins; the epitopes were concentrated in the predicted regions.

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- 0/14 HLA-A3 positive individuals had detectable A3-restricted responses to this epitope during acute infection, but only 5/15 of HLA-A3 epitopes tested were targeted during acute infection. 1/7 individuals had detectable responses to this epitope after STI.

References Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found highly variable regions found in Nef, Env and p17.
- While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint

on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.

- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.
- What was learned from proteins where many epitopes have been defined (Gag, Pol, Env and Nef) was used to develop an algorithm to predict where epitopes would be localized in Rev, Tat, Vif, and Vpr. Keywords escape

References Schutten *et al.* 2001

- Molecularly cloned primary NSI macrophage tropic strain 2.1 and SI non-macrophage tropic strain 1.2 were isolated from study participant ACH320 and used to infect irradiated XID mice that had been reconstituted with human PBMC from B14+ seronegative donors – results indicate CTL may favor selective outgrowth of macrophage tropic strains.
- The CTL clone TCC108 specific for SAEPVPLQL, previously described by van Baalen 1997, and van Baalen 1998, was stimulated *in vitro* and given to the mice to apply specific CTL pressure.
- The macrophage-tropic HIV-1 strain #2.1 escaped CTL pressure more efficiently (7/14 animals) than its non-macrophage-tropic counterpart #1.2(SI) – the latter isolate was suppressed in 13/14 animals – macrophage may serve as a CTL sanctuary and reduced pressure on macrophage tropic HIV strains may allow additional replication to assist with acquisition of escape.

- Specific HIV-1 variants selectively induced by TCC108 were for strain 1.2: SEEPVPLQL, and for strain 2.1: SAEHVPLQL, SAESVPLQL, SVEPVPLQL, SLEPVPLQL, SAEPVPFQL, and SAEPVPFQL.

Keywords acute infection, early-expressed proteins, kinetics

References van Baalen *et al.* 2002

- Tat, Rev and Nef are the first HIV proteins expressed upon acute infection of T-cells (< 6 hours), and RT is not expressed until after 24 hours. The B14-restricted Rev-SAEVPLQL specific CD8 T-cell clone TCC108, and the B57-restricted RT-IVLPEKDSW specific CD8 T-cell clone TCL1C11 were co-incubated with CD4+ cultures inoculated with HIV-1 at low MOI. Co-incubation with the Rev-specific CTL resulted in two logs less HIV-1 production in ten days of culture. When the RT epitope was cloned into the Nef gene of the infecting strain, another early expressed protein, it proved as effective as the Rev epitope at inhibiting viral production. A mathematical model of CTL-target interactions suggest early proteins are important for vaccine design.

Assay type CD8 T-cell Elispot - IFN γ

Keywords binding affinity, acute infection, early-expressed proteins

References Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15–92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

- Splenocytes from BALB/c mice immunized with pVVN-P DNA were incubated with Vif, Vpu or Nef antigens for 3 days and assayed for IL-4 and IFN-gamma levels.
- Antigen stimulation increased IFN-gamma production in pVVN-P immunized mice, indicating a Th1 response.
- IL-4 production was not significantly changed after antigen stimulation compared to control levels.
- Cross-clade CTL activity was also observed: A, B clade, CRF01(AE) clade antigens could serve as targets for the B clade immunization-stimulated CTL – an HIV-1 AC recombinant, however, did not stimulate a CTL response, but was expressed at lower levels on the target cell.

II-B-19 gp160 CTL, CD8+, epitopes

HXB2 Location gp160 (2–10)**Author Location** gp160 (2–10 IIIB)**Epitope** RVKEYQHL**Immunogen** HIV-1 infection**Species (MHC)** human (B*0801)**Keywords** optimal epitope**References** Frahm *et al.* 2004

Keywords rate of progression, escape

References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0–80% as efficiently as the index peptide, and the relatively efficiency of the variant epitopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This was one of 8 reactive peptides found not to vary over time. It was one of four epitopes that were not precisely defined.

Keywords dynamics, immunodominance, escape, acute infection, kinetics, characterizing CD8+ T cell responses, reversion, viral fitness

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.
- This was the immunodominant response in acute infection in WEAU, and there was rapid escape in the epitope AENLWVTYV, with three variants observed by day 30 from the onset of symptoms. Additional mutations continued to develop, so that there were 9 different forms observed through the course of sampling. The variants all conferred different levels of reduction in CTL response, double mutations or anchor mutations tended to cause the greatest reduction: AaNLWV-TaY, tNkWVTYV, AgNLWVTYV, AkNLWVTYV, although the double mutant tENLWVTiY elicited a very strong CTL response, suggesting it might not be an escape form.

- 21% (40/187) of Thai adults that received ALVAC-HIV with or without gp120 or oligomeric gp160 had a CD8+ T-cell response. HLA-B44 was positively associated with CTL responses, and A33/B44/DRB1*0701 is the most common haplotype in Thailand. B46, present in 30% of the population, was negatively associated with CTL responses, although it did not reach significance. HLA class I serotypes A11, A24, A33, B46 and B75 were the most common found in 245 Thai volunteers.
- 9/11 cases of pCTL activity to Env were in people with B44. The authors suggest some of the response may be directed at the previously mapped B44 Env epitope AENLWTVVYY in HXB2, DNLWTVVYY in their CRF01 ALAVC vaccine 92TH023. B*4403 is the most common B44 allele among Thais, while B*4402 is more common among Caucasians; a prior study had shown that B*4403 may be able to present a broader spectrum of epitopes than B*4402.

- Ten HIV-1 + HLA A2 asymptomatic individuals were given two courses of HIV-1 MN rgp160 vaccine over a 2 year period.
- Two hundred and fifty three HIV-1 peptides of 9 or 10 aa possessing the HLA-A2.1 binding motif (Leu at position 2, Val at the C terminus) were identified in gp160, of which 25 had a high or intermediate binding affinity.
- Eleven peptides were studied that had high HLA-A2 binding affinity – a CTL response was detected to 9/11 peptides in at least 1 individual.
- CTL responses after reimmunization may include recall responses – only individuals with vaccine cross-reactive sequences prior to vaccination showed detectable CTL responses.

HXB2 Location gp160 (34–42)**Author Location****Epitope** LWVTVYYGV**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A*0201)**Assay type** cytokine production, proliferation, Tetramer binding, Intracellular cytokine staining, Chromium-release assay**References** Dagarag *et al.* 2003

- Telomere length is short in the CD8+ T-cell compartment of HIV-1 infected people, indicating excessive CTL activation and premature senescence. Here human telomerase RT (hTERT) transduction of HIV-1-specific CTL was used to study the functional impact of telomerase. Telomerase expression enhanced proliferative capacity, as well as cytolytic and antiviral capabilities; cytokine production was unchanged. hTERT transduced CTLs were 10-fold more efficient in controlling HIV-1 replication in culture. Thus telomerase transduction can restore CTL mediated cytolysis, and may have therapeutic potential.
- Three polyclonal CD8+ T-cell lines derived from an HIV-1, HLA A*0201 positive patient were used in this study, including one specific for this epitope.

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade *HIV component:* p17 Gag, p24 Gag

Species (MHC) human (A*0301)

Keywords inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used

in a phase III clinical trial in Kenya. This epitope is included in the polypeptide string Hanke & McMichael [2000].

- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ ELISPOT assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polypeptide region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polypeptide string Wee *et al.* [2002].

HXB2 Location gp160 (37–46)

Author Location Env

Epitope TVYYGVPVWK

Immunogen Vaccine

Vector/Type: DNA

Species (MHC) transgenic mouse (A11)

References Ishioka *et al.* 1999

- A minigene vaccine construct encoding 6 HLA 2.1 and 3 HLA A11 restricted CTL epitopes, the universal Th cell epitope PADRE (pan-DR epitope) and an ER translocating signal sequence was constructed.
- The epitopes were chosen for dominant recognition by CTLs during HBV and HIV infections in humans.
- HLA transgenic mice were used for quantitating *in vivo* immunogenicity of DNA vaccines encoding HLA-restricted CTL epitopes.

Epitope TVYYGVPVWK

Immunogen Vaccine

Vector/Type: canarypox *Strain:* B clade

LAI, B clade MN *HIV component:* Gag,

gp120, gp41, Protease

Species (MHC) human (A3)

References Carruth *et al.* 1999

- The vaccine used was a live recombinant canarypox (CP) virus vaccine containing multiple HIV-1 genes (HIV-1 MN gp120, HIV-1 LAI gp41, HIV-1 LAI Gag, HIV-1 LAI protease)
- CD4+ and CD8+ Gag and Env specific CTL responses were detected in only 1/5 vaccinated volunteers, and were not detectable 1 year after vaccination.
- CTL responses to epitopes SLYNTVATL and TVYYGVPVWK from HIV+ control patients were used as positive controls.
- The study explored why vaccinees were non-responsive – non-response was not due to inherent defects or differences in the ability of these individuals to process and present antigen.

Epitope TVYYGVPVWK

Immunogen HIV-1 infection

Species (MHC) human (A3)

Keywords rate of progression, acute infection

References Day *et al.* 2001

- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)
- 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.
- All patients recognized at least 1 A3 epitope, up to 8 A3 epitopes, but none was clearly dominant.

HXB2 Location gp160 (37–46)

Assay type CD8 T-cell Elispot - IFN γ , Flow cytometric CTL assay
Keywords rate of progression, escape
References Geels *et al.* 2003
- Both stable potential epitopes and epitopes with escape mutations were found in a patient with increasing viral load over a time period of 4 years. Fixation of escape mutations occurred sequentially and correlated with the rise in viral load and with the increased number of productively infected cells.
 - This is one of 17 potential epitopes from this individual, defined based on previously identified epitopes presented by appropriate HLA molecules. Full length genome sequence did not reveal changes in time in any of these epitopes over a four year period. Peptide pools initially revealed very little response to these epitopes, but this increased over time.

Author Location gp120
Epitope TVYYGVPVWK
Immunogen HIV-1 exposed seronegative
Species (MHC) human (A3)
Donor MHC A01, A03, B39, B44, Cw4, Cw6
Assay type T-cell Elispot
Keywords HIV exposed persistently seronegative (HEPS)
References Missale *et al.* 2004
- HIV-specific T-cell response was tested in HIV-uninfected patients exposed to blood from a patient with highly replicating HIV; these same patients were nosocomially infected with HBV. HIV-specific T-cell responses were directed to structural and non-structural HIV proteins in two patients suggesting that the virus replicated in these patients sufficiently to prime a cell-mediated immune response that protected these individuals from HIV infection.
 - This patient responded to 3/11 HIV epitopes tested in an IFN γ assay. Responses were detected 16 and 20 weeks after exposure, but were lost by week 80.
- HXB2 Location** gp160 (37–46)
Author Location Env (49–58)
Epitope TVYYGVPVWK
Immunogen HIV-1 infection
Species (MHC) human (A3 supertype)
Keywords supertype, rate of progression

References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind 3/5 HLA-A3 supertype alleles (A*0301, A*1101, A*3101, A*3301 and A*6801).

HXB2 Location gp160 (38–48)**Author Location** gp120 (45–55)**Epitope** VYYGVPVWKEA**Immunogen** HIV-1 infection**Species (MHC)** human (Cw7)**References** Nehete *et al.* 1998a

- Three long-term non-progressors and one asymptomatic HIV+ individual were studied and found to have HLA class I C-restricted CD8+ Env-specific CTLs – Cw7 specific CTL were found against three peptides, including this one.
- HLA-C antigens are expressed on lymphoid cells to a lesser extent than either HLA-A or -B.
- HLA-C confers protection against lysis by natural killer cells and by non-MHC-restricted effector T cells and Cw7 directly governs this resistance to lysis – the authors hypothesize that pathogens that inhibit antigen expression and class I expression may particularly down regulate Cw7, thus triggering non-MHC restricted killing.

Assay type CD8 T-cell Elispot - IFN γ
Keywords characterizing CD8+ T cell responses
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Assay type CD8 T-cell Elispot - IFN γ , CD4 T-cell Elispot - IFN γ
Keywords rate of progression, escape
References Oxenius *et al.* 2004b
- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0–80% as efficiently as the index peptide, and the relatively efficiency of the variant epitopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
 - This was one of 8 reactive peptides found not to vary over time. It was one of four epitopes that were not precisely defined.

Keywords acute infection
References Wilson *et al.* 2000a

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and a close temporal relationship between the number of circulating HIV-specific T cells and viral load.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWILGGLNK.
- The subject with A*0201 had a moderately strong response to SLYNTVATL.
- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.
- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

Epitope DPNPQEVVL
Immunogen HIV-1 infection
Species (MHC) human (B35)
Keywords HAART, ART, acute infection
References Altfeld *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.

- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-B35+ individuals that had a CTL response to this epitope broken down by group: 1/2 group 1, 0/2 group 2, and 0/1 group 3.

Assay type CD8 T-cell Elispot - IFN γ

Keywords binding affinity, acute infection, early-expressed proteins

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cell responses

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Assay type CD8 T-cell Elispot - IFN γ , CD4 T-cell Elispot - IFN γ

Keywords rate of progression, immunodominance, escape

References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0-80% as efficiently as the index peptide, and the relatively efficiency of the variant epitopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This epitope was one of six epitopes found to be under positive selection for escape mutations, and was mostly replaced by an escape variant between days 66 and 369 (dpnpqeAal) and then replaced by a new escape variant (dpnpqevPl) by day 635.

Assay type CD8 T-cell Elispot - IFN γ , Flow cytometric CTL assay
Keywords rate of progression, escape
References Geels *et al.* 2003
- Both stable potential epitopes and epitopes with escape mutations were found in a patient with increasing viral load over a time period of 4 years. Fixation of escape mutations occurred sequentially and correlated with the rise in viral load and with the increased number of productively infected cells.
 - This is one of 17 potential epitopes from this individual, defined based on previously identified epitopes presented by appropriate HLA molecules. Full length genome sequence did not reveal changes in time in any of these epitopes over a four year period. Peptide pools initially revealed very little response to these epitopes, but this increased over time.

Epitope KLTPLCVTL

Immunogen Vaccine

Vector/Type: vaccinia

Species (MHC) human (A2)

References Woodberry *et al.* 1999

- A polyepitope vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2.
- HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D^d – this transgene is the only MHC molecule expressed in the mice.
- CTL responses to Gag (77–85) SLYNTVATL, Pol (476–484) ILKEPVHGV, gp120 (120–128) KLTPLCVTL, and Nef (190–198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost.
- No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157–166 (PLTFGWCYKL), Pol 346–354 (VIYQMDDL), and Nef 180–189 (VLEWRFDSRL)
- Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested.
- KLTPLCVTL was recognized by 3 of the patients.

HXB2 Location gp160 (121–129)

Author Location gp120 (120–128)

Epitope KLTPLCVTL

Immunogen HIV-1 infection

Species (MHC) human (A2)

Keywords dendritic cells

References Kundu *et al.* 1998b

- Allogeneic dendritic cells (DCs) were obtained from HLA-identical siblings, pulsed with rgp160 MN or A2-restricted HIV-1 epitope peptides, and infused monthly into six HIV-infected patients.
- 1/6 showed increased env-specific CTL and increased lymphoproliferative responses, 2/6 showed increase only in proliferative responses, and 3/6 showed no change – pulsed DCs were well tolerated.
- KLTPLCVTL is a conserved HLA-A2 epitope included in this study – all six patients had this sequence as their HIV direct sequence, and a detectable CTL response.
- CTL demonstrated against peptide-coated target, epitope is naturally processed and enhancible with vaccine.

Keywords vaccine-specific epitope characteristics

References Kiszka *et al.* 2002

- Transgenic mice expressing a HLA-A2/Kb chimeric protein were vaccinated with a full length gp160 or with gp160deltaV3, with the V3 loop deleted. Mice given gp160deltaV3 had a broader immune response than those given gp160, with increased responses to conserved HLA-A2 epitopes in the C1 region of gp120, KLTPLCVTL, and the C-term region of gp41, SLLNATAIAV.
- Greater resistance was conferred by the gp160deltaV3 than the gp160 vaccine to a challenge of vaccinia expressing heterologous gp160 from primary isolates (VI-06 and 89.6), and the resistance was conferred by CD8+ T-cells.

Immunogen HIV-1 infection
Species (MHC) human (A2)

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay, Flow cytometric CTL assay

Keywords binding affinity, inter-clade comparisons, computational epitope prediction

References Corbet *et al.* 2003

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This epitope was one of the previously identified HLA-A2 epitopes studied.
- 3/17 HIV-infected HLA-A2+ people recognized this epitope.

HXB2 Location gp160 (121–129)

Epitope KLTPLCVTL
Immunogen HIV-1 infection
Species (MHC) human (A2 supertype)
Keywords supertype, rate of progression
References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind four of the five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802).

Keywords epitope processing

References Ferris *et al.* 1999

- Recognized by CTL clone LWF A5, isolated from a lab worker exposed to HIV-1 in 1985.
- The processing of this epitope is TAP1/2-dependent, as are most Env epitopes, and it contains two N-linked glycosylation sites that are glycosylated in Env.
- Only peptide that has been deglycosylated, a process that changes asparagine (N) to aspartic acid (D) was recognized: the aspartic acid at position 5 was critical, position 1 could be either D or N.
- This peptide also contains a Cys involved in a disulfide linkage but reducing conditions did not effect recognition by CTL clone LWF A5.
- The HIV-1 Env epitopes are typically processed by a TAP1/2 dependent mechanism, which involves cotranslational translocation into the ER, glycosylation, export back into the cytosol, and deglycosylation for processing, and retransport into the ER for the association with class I molecules.
- The particular pathway of generating an epitope may have an impact on the presentation of that epitope, quantitatively as well as qualitatively.

HXB2 Location gp160 (156–165)

Author Location gp120 (156–165 IIIB)

Epitope NCSFNISTSI

Immunogen HIV-1 infection

Species (MHC) human (Cw8)

References Sipsas *et al.* 1997

- HIV IIIB proteins were used to define the range of CTL epitopes recognized by 3 lab workers accidentally infected with HIV-1 IIIB.
- NCSFNITTSI, a variant found in HIV-1 MN, was not recognized, thus this epitope was type-specific.
- NCSFNISTSI contains two potential N-linked glycosylation sites and cysteine residue, possibly related to the requirement for a high sensitizing dose of peptide for CTL activity.

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0–80% as efficiently as the index peptide, and the relatively efficiency of the variant epitopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This was one of 8 reactive epitopes found not to vary over time.

HXB2 Location gp160 (192–200)**Author Location** gp120 (199–207)**Epitope** TLTSCNTSV**Immunogen** HIV-1 infection**Species (MHC)** human (A2.1)**References** Brander *et al.* 1996

- The responding subject was HLA-A2, -B21.

HXB2 Location gp160 (199–207)**Author Location** Env (202–210)**Epitope** SVITQACPK**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A*1101)**Keywords** inter-clade comparisons, TCR usage**References** Fukada *et al.* 2002

- Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A-E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals.
- SVITQACPK was found to elicit clade-specific responses in clade B (SVITQACPK is most common, sAitqacpk is most common variant in clade A, C and D) and clade E (saiKqacpk is most common). SVITQACPK was recognized by CTL from 3/5 B clade infected Japanese subjects, and aiKqacpk by CTL from 0/7 E clade infected Thai subjects, so this seems to be a B clade exclusive epitope.
- The binding of the three variant peptides to HLA A*1101 was comparable, implicating TCR interaction differences.

- Predefined immunodominant peptide responses were used to compare CD8+ T cells responses in the blood and cervix of 16 HIV+ Kenyan sex workers. Cervical responses were detected in 8/10 women from whom adequate samples could be obtained. The frequency of the CD8+ T cell response in the genital tract was comparable to the blood, with a trend toward being slightly higher.
- The immunodominant response was to this epitope in the PBMC of 1/16 patients (Kaul *et al.* 2001, AIDS, 107:1303).

HXB2 Location gp160 (208–219)**Author Location** Env**Epitope** VSFEPIPPHYCA**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Keywords** epitope processing**References** Cao *et al.* 2002

- SP 511 is an A2 restricted CTL clone generated from a Ugandan subject that recognizes VSFEPIPPHYCA.
- CTL could be activated by a fusion protein of an HIV protein and anthrax lethal factor (LFn-HIV) that promotes antigen presenting cell uptake of exogenous protein and allows processing through the MHC class I pathway. This strategy for CTL detection could allow antigen presentation without generation of cells by the standard methods of using live viral vectors

carrying a protein, or by loading the cells with peptides and by-passing processing.

HXB2 Location gp160 (209–217)**Author Location** gp160 (207–215 BORI, WEAU)**Epitope** SFEPIPIHY**Epitope name** gp160 SY9**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A*2902)**Donor MHC** A*2902, B*1402, C*0802; A*2902, B*4403, B*0801**Country** United States.**Assay type** CD8 T-cell Elispot - IFN γ , Chromium-release assay**Keywords** dynamics, immunodominance, escape, acute infection, characterizing CD8+ T cell responses, reversion, viral fitness**References** Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined, WEAU and BORI, had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape. This epitope was recognized in both patients.
- The patient BORI had high viral loads and rapid CD4 decline. BORI mounted 8 detected responses. BORI did not control viral replication well, and escape mutations occurred early and in most epitopes, 6/7 that were precisely identified. The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.
- Four escape variants to the SFEPIPIHY epitope were found in the patient BORI. SFdPIPIHY came up first, at day 55 from onset of symptoms, and caused a reduced cytotoxic response. By day 218, two rare forms were found, SIEPIPIHf and SiEPIPIHf. By day 556, only tFEPIPIHY was found. The weakest response was detected in the double mutant, SiEPIPIHf, yet tFEPIPIHY was the form that persisted.
- In WEAU, a minor variant, SsEPIPIHY was present at day 41. The SIEPIPIHf variant first came up day 136, gave a reduced CTL response, and then came to be the dominant form. Other variants were SFEPIPIHY and SFEPIPIdf.

Assay type CD8 T-cell Elispot - IFN γ
Keywords binding affinity, acute infection, early-expressed proteins
References Cao *et al.* 2003
- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15–92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
 - Two subjects recognized this epitope during primary infection, both in the context of A29.
 - All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
 - More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Assay type CD8 T-cell Elispot - IFN γ
Keywords characterizing CD8+ T cell responses
References Kiepiela *et al.* 2004
- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
 - This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Keywords assay standardization/improvement, memory cells, characterizing CD8+ T cell responses
References Lichterfeld *et al.* 2004c
- Using a flow-cytometric cytotoxicity assay based on caspase-3 activation in dying target cells, it was shown that the subset of HIV-1-specific CD8+ T-cells secreting both IFN-gamma and TNF-alpha exhibit stronger cytotoxic activity than those secreting only IFN-gamma. These cells also exhibited stronger intracellular perforin expression. No association between HIV-1-specific CD8+ T-cell maturation phenotypes and intracellular perforin expression was found.
 - 1/9 individuals recognized this epitope

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay
Keywords dynamics, immunodominance, escape, acute infection, kinetics, characterizing CD8+ T cell responses, reversion, viral fitness
- References** Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient BORI had high viral loads and rapid CD4 decline. BORI mounted 8 detected responses. BORI did not control viral replication well, and escape mutations occurred early and in most epitopes, 6/7 that were precisely identified.
- Four variants of the CKNVSTVQC epitope were found in the patient BORI. CeNVSTVQC and cCeNVSTVhC came up first, at day 6 from onset of symptoms. The CeNVSTVQC form was the form that persisted, with a second rare variant present at day 35, CgNVSTVQC. These variants were not tested for their impact on escape.

Immunogen Vaccine**Vector/Type:** lipopeptide**Species (MHC)** human**References** Gahery-Segard *et al.* 2000

- Anti-HIV lipopeptide vaccine consisting of six long amino acid peptides derived from Nef, Gag and Env HIV-1 proteins modified by a palmitoyl chain was administered in a phase I trial.
- A CD4+ T cell proliferative response to at least one of the six peptides was observed in 9/10 vaccinees – 6/10 reacted to this peptide.
- 9/12 tested mounted a CTL response to at least one of the six peptides; each of the six peptides elicited a CTL response in at least one individual – this peptide was particularly immunogenic, eliciting a CTL response in five vaccinees.
- None of the 12 tested had an IgG response to gp120 or gp160 and vaccinees could be differentiated from HIV-1 seropositive individuals with a commercial HIV detection kit – no neutralizing antibodies were observed.

HXB2 Location gp160 (298–307)**Author Location** gp120 (298–307)**Epitope** RPNNTTRKSI**Immunogen** HIV-1 infection**Species (MHC)** human (B*07)**Keywords** epitope processing, TCR usage**References** Ferris *et al.* 1999; Hammond *et al.* 1995

- The processing of this epitope is TAP1/2-dependent, as are most Env epitopes, and it contains an N-linked glycosylation site that is glycosylated in Env.
- Peptide that had been deglycosylated, a process that changes asparagine (N) to aspartic acid (D) (RPNDNTRKSI) was recognized a 100-fold more efficiently than either glycosylated or non-glycosylated RPNNTTRKSI.
- Position 5 is not involved with HLA B*07 binding, so is probably important for TCR recognition.
- HIV-1 Env epitopes are typically processed by a TAP1/2 dependent mechanism, which involves cotranslational translocation into the ER, glycosylation, export back into the cytosol, and deglycosylation for processing, and retransport into the ER for the association with class I molecules.
- The particular pathway of generating an epitope may have an impact on the presentation of that epitope, quantitatively as well as qualitatively.

HXB2 Location gp160 (298–307)**Author Location** gp120 (302–312 HXB2)**Epitope** RPNNTTRKSI**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B*0702)**Keywords** optimal epitope**References** Frahm *et al.* 2004

HXB2 Location gp160 (298–307)**Author Location** (C consensus)**Epitope** RPNNTTRKSI**Subtype** C**Immunogen** HIV-1 infection**Species (MHC)** human (B*4201)**Country** South Africa.**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** characterizing CD8+ T cell responses**References** Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location gp160 (298–307)**Author Location** gp120 (302–312 HXB2)**Epitope** RPNNTTRKSI**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B7)**References** Safrit *et al.* 1994b

Epitope RKSIRIQRGPGRAV

Immunogen Vaccine

Vector/Type: virus-like particle (VLP)

Strain: B clade IIIB, B clade MN, B clade RF, B clade SF2, HIV-2 VLP *HIV component:* Gag, V3

Species (MHC) mouse (H-2^d)

References Kang *et al.* 1999

- Virus-like particles could be formed from HIV-2 gag after deleting 143 amino acids at the C-terminal end – a proline rich region in positions 373–377 was critical to VLP formation.
- CTL responses in BALB/c mice were induced by chimeric gag-V3 particles against the V3 region of HIV-1 clade B isolates IIIB (SIRIQRGRAFTI), MN (KRIHIGPGRAFYTTK), RF (SITKGPGRVIYATGQ), and SF2 (SIYIGPGRAFHTTGR)
- The vaccine induced CTL were cross-reactive with a broad spectrum of B clade isolates, with the exception of the RF V3 which did not induce CTL.

HXB2 Location gp160 (305–321)

Author Location gp120 (MN)

Epitope KRIHIGPGRAFYTTK

Subtype B

Immunogen HIV-1 infection

Species (MHC) human

Donor MHC A2

Assay type CD8 T-cell Elispot - IFN γ

Keywords assay standardization/improvement, HAART, ART

References Chitnis *et al.* 2003

- 17 perinatally HIV-1 infected children (0.08-16 years) were evaluated for HLA-A2-restricted IFN- γ CD8+ CTL responses against 4 immunodominant peptides that carry HLA-A2 epitopes. Two peptides were from gp120 (one at position 112, one from the V3 loop), and one each was from gp41 and Gag. 15/17 patients responded to the Gag peptide, 13/17 to the gp41 and the non-V3 gp120 peptides, and 11/17 responded to the V3 loop. 4 children recognized all 4 peptides.

Immunogen Vaccine

Vector/Type: peptide *Strain:* B clade IIIB
HIV component: V3

Species (MHC) mouse (Dd)

Keywords binding affinity, Th1

References Ahlers *et al.* 2001

- BALB/c and A.AL were immunized with an Env-peptide vaccine construct containing the CTL epitope P18IIIB and the T helper epitope T1, KQINMWQEVGKAMYA.
- Substitution of Glu (wt) to Ala in T1, kqiinmwqAvgkamyA, caused increased affinity for MHC class II Ek, resulting in the upregulation of CD40L in the responding Th cells, and shifting the response towards Th1. Increased Th responses stimulated DCs to produce higher levels of IL-12, and B7-1 and B7-2, and enhanced CTL responses to P18.
- The modified epitope, T1A, elicited stronger protection against increasing doses of viral challenge with vaccinia expressing HIV-1 IIIB gp120 compared to the wt epitope T1.

Epitope RIQRGPGRFVTIGK
Immunogen Vaccine
Vector/Type: DNA *Strain:* B clade IIIB
Adjuvant: FLt3 ligand (FL), GM-CSF, IL-12, IL-15, IL-2
- Species (MHC)** mouse
Keywords vaccine-specific epitope characteristics
References Moore *et al.* 2002a
- Intramuscular immunization of BALB/c mice with DNA vaccines carrying either gp160 or Nef in the expression vector plasmid pNGVL gave different responses – gp160 induced strong gp160-specific CTL and IFN-responses and low-titer humoral responses, and Nef generated humoral (IgG1, IgG2a) responses and IFN-responses but little CTL activity.
 - Co-injection of DNA plasmids encoding cytokines and/or hematopoietic growth factors, IL2, IL-12, IL-15, Flt3 ligand (FL), and GMCSF tended to give responses that were enhanced quantitatively, but not altered qualitatively.
 - Co-administration of GMCSF most strongly enhanced CTL and IFN-responses against pNGVL-gp160.
 - Repeated immunization with pNGVL-Nef failed to induce CTL responses. Co-administration of IL-12 most strongly enhanced humoral and IFN γ responses.
 - FL, which enhances innate immune responses, in combination with IL-2, IL-12 or IL-15 generated with most potent Nef responses.

Immunogen Vaccine

Vector/Type: DNA, DNA with protein boost
Strain: B clade IIIB *HIV component:* gp160
Adjuvant: IL-12

Species (MHC) mouse (A2)

Keywords vaccine-specific epitope characteristics

References Kiszka *et al.* 2002

- Transgenic mice expressing a HLA-A2/Kb chimeric protein were vaccinated with a full length gp160 or with gp160deltaV3, with the V3 loop deleted. Mice given gp160deltaV3 had a broader immune response than those given gp160, with increased responses to conserved HLA-A2 epitopes in the C1 region of gp120, KLTPLCVTL, and the C-term region of gp41, SLLNATAIAV.
- Greater resistance was conferred by the gp160deltaV3 than the gp160 vaccine to a challenge of vaccinia expressing heterologous gp160 from primary isolates (VI-06 and 89.6), and the resistance was conferred by CD8+ T-cells.
- The most intense CTL responses to the intact gp160 vaccine were directed at three V3 peptides.

Keywords rate of progression, escape

References Geels *et al.* 2003

- Both stable potential epitopes and epitopes with escape mutations were found in a patient with increasing viral load over a time period of 4 years. Fixation of escape mutations occurred sequentially and correlated with the rise in viral load and with the increased number of productively infected cells.
- This is one of 17 potential epitopes from this individual, defined based on previously identified epitopes presented by appropriate HLA molecules. Full length genome sequence did not reveal changes in time in any of these epitopes over a four year period. Peptide pools initially revealed very little response to these epitopes, but this increased over time.

- The TCR repertoire and its specificity was studied through analyzing the spectrum of TCR-alpha and beta chains able to reconstitute a reaction to the H-2 Dd-restricted P18 peptide. The RT-1 TCR alpha chain was able to react with 1/3 of the tested TCR beta chains to create a specific response. Experiments in transgenic mice also supported the observation that a single TCR alpha chain would confer the specificity of the response and could interact with a large variety of TCR beta chains.

Species (MHC) mouse (H-2^d)

Keywords Th1

References Uno-Furuta *et al.* 2001

- Peptide immunization usually doesn't elicit a good CTL response because epitopes are not internalized and processed and presented, so vaccination with electric pulsing was tried (i.m. injection followed by 8 electric pulses), to enhance peptide uptake through electroporation.
- BALB/c immunized with HIV P18 or hepatitis C P17 peptides with an electric pulse elicited a CTL response, those that did not receive the pulse did not.
- The CTL response was enhanced by addition of immunostimulatory sequences ISS in the plasmid pCMV-LacZ, that contains hexamers GACGTC, AGCGCT, AACGCT, sequences common in prokaryotic genomes but rare in eukaryotic genomes that elicit Th1 cytokines and result in B cell and T-cell proliferation.
- The CTL response was also enhanced by addition of B7-1 cDNA – the B7 family of proteins transduce co-stimulatory signals through interaction with CD28.

- Bacillus anthrax lethal toxin (LFn)-HIV fusion proteins are candidate HIV vaccines that are safe in mice, and LFn-V3 region fusion proteins induce CD8 T cells in BALBc mice. LFn causes exogenous protein to be taken up and processed in a class I pathway. Expressed proteins from Gag p24 and nef fragments cloned into the LFn expression plasmid stimulate gag-specific CD4 proliferation and CTL responses in HIV-infected donor PBMCs *in vitro*.

Immunogen Vaccine
Vector/Type: peptide *Strain:* B clade IIIB
HIV component: V3 *Adjuvant:* Cholera toxin (CT), GM-CSF, IL-12, IL-18, IL-1 α
- Species (MHC)** mouse (H-2D^d)
- References** Staats *et al.* 2001
- Cholera toxin (CT) is a potent adjuvant used in animal studies that is not safe in humans, so combinations of cytokines were used in nasal immunization of BALB/c mice V3 peptides to attempt to replace CT as a potent adjuvant.
 - Peptide vaccine induced CTL activity was significantly increased by IL-1 α , IL-18, and GM-CSF given alone as adjuvant, but CT gave more potent CTL activity than any single cytokine.
 - Combinations of cytokines could be more potent than CT as an adjuvant. The highest tetramer binding of H-2Dd peptide-specific PBMC after nasal immunization was observed with IL-1 α plus IL-18 as adjuvant.
 - Nasal immunization with HIV peptide in the presence of IL-1 α , IL-12 and GM-CSF induced IFN- γ -secreting cells in the cervical lymph node, the lung and the spleen, and was associated with upregulation of MHC class II and B7.1 on nonlymphocytes in NALT/nasal mucosal cells.
 - Consistent results were obtained for the IIIB and the MN peptides.

Epitope RIHIGPGRAFYTTKN
Epitope name P18
Immunogen in vitro stimulation or selection
Species (MHC) mouse (H-2D^d)
Donor MHC H-2d
Keywords TCR usage
References Yokosuka *et al.* 2002
- The TCR repertoire and its specificity was studied through analyzing the spectrum of TCR- α and β chains able to reconstitute a reaction to the H-2 Dd-restricted P18 peptide. The RT-1 TCR α chain was able to react with 1/3 of the tested TCR β chains to create a specific response. Experiments in transgenic mice also supported the observation that a single TCR α chain would confer the specificity of the response and could interact with a large variety of TCR β chains.

Vector/Type: protein *Strain:* B clade IIIB *HIV component:* gp120 *Adjuvant:* poly(I:C), lipopolysaccharide (LPS)
- Species (MHC)** mouse (H-2D^d)
- Assay type** Chromium-release assay
- Keywords** epitope processing, vaccine-induced epitopes, Th1, Th2, immunotherapy, adjuvant comparison
- References** Fujimoto *et al.* 2004

- When BALB/c mice were immunized with recombinant HIV-1 Env gp120 or Influenza HA protein together with polyriboinosinic polyribocytidylic acid (poly (I:C)), an epitope-specific CD8+ class I MHC-restricted CTL response was observed. This response was not observed when LPS was used as adjuvant instead of poly (I:C) indicating activation of cellular immunity by poly (I:C). In the presence of poly (I:C), immature DC presented processed external antigen in association with class I MHC.

HXB2 Location gp160 (309–317)

Immunogen HIV-1 infection

Species (MHC) human (A11)

Keywords inter-clade comparisons

References Bond *et al.* 2001

- HLA-A11 CRF01 (called subtype E in Bond *et al.*) epitopes were identified that stimulated CTL from HIV+ female sex workers (FSW) from Northern Thailand, of whom more than half were HLA-A11 positive.

- 77 possible HLA-A11 epitopes were first defined using EpiMatrix, these were screened for binding to A11 finding and 26 bound, and 12 of these were epitopes for CTL responses from 8 HLA-A11 positive FSWs, six were novel, six were previously identified.

- This is one of the new A11 epitopes identified through the streamlined EpiMatrix method, and 2/8 tested FSWs recognized it.

- This epitope was not conserved in other subtypes, and exact matches were rare.

Keywords dynamics, immunodominance, acute infection, kinetics, characterizing CD8+ T cell responses, reversion, viral fitness

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.
- This was one of five reasonably strong responses in early infection in the patient WEAU, and the epitope sequence did not vary during the first year of the infection.

Immunogen

Species (MHC) mouse (H-2^d)

Keywords epitope processing, immunodominance

References Lopez *et al.* 2000

- A series of protease and proteasome inhibitors was used to identify elements of the processing pathway of this epitope, called p18, both from within Env and from within a chimeric hepatitis B protein which allows proper processing.
- Lactacystin, a proteasome inhibitor, partially inhibits endogenous processing of p18 epitope suggesting both a proteasome pathway and an additional pathway can be used.
- Both TAP dependent and TAP-independent pathways can be used.
- 1,10-phenanthroline (metallopeptidases inhibitor) blocks epitope presentation demonstrating metalloproteinase processing in the Tap-dependent pathway.
- The Tap-independent pathway does not involve processing by metalloproteinases.
- This epitope is immunodominant in mice, and is presented by multiple human HLA alleles – it has been suggested that the high processing efficiency of this epitope might result in poor presentation of co-expressed epitopes.

- Vaccinated mice elicited a CTL response to a gene gun-delivered multiepitope vaccine to two epitopes studied that are known to elicit CTL in mice: SYIPSAEKI from Plasmodium berghei and RGPGRFVTI from HIV-1 Env.
- Different vaccination protocols were tested and it was found that a gene gun mediated delivery followed by an MVA boost was as good as i. m. immunization followed by a MVA boost – this is advantageous as gene gun delivery requires far less DNA than i.m. DNA priming.
- CTL activity was high (60% - 70% specific lysis at effector target) when vaccinated with a single gene gun immunization and an MVA boost, and improved with two gene gun vaccinations.

HXB2 Location gp160 (311–320)**Author Location** Env (IIIB)**Epitope** RGPGRFVTI**Epitope name** I-10**Immunogen** in vitro stimulation or selection**Species (MHC)** mouse (H-2D^d)**Keywords** epitope processing, immunodominance**References** Nakagawa *et al.* 2000

- The CTL line LINE-IIIB was generated by repetitive restimulation of BALB/c spleen cells with vSC-25, IIIB gp160-expressing vaccinia.
- RGPGRFVTI represents the active minimal epitope within the previously described immunodominant epitope P18IIIB (RIQRGPGRFVTIGK, gp160(308-322))
- External processing of P18IIIB results in the removal of the 2 C-terminal residues (GK) of I-10 by ACE (angiotensin-1-converting-enzyme) in sera to produce I-10, and this processing is essential for target cell presentation of RIQRGPGRFVTIGK.

HXB2 Location gp160 (311–320)**Author Location** Env (IIIB)**Epitope** RGPGRFVTI**Epitope name** p18-I10**Immunogen** Vaccine*Vector/Type:* vaccinia, vesicular stomatitis virus (VSV) *Strain:* B clade HXB2, B clade IIIB *HIV component:* Env, Gag**Species (MHC)** mouse (H-2D^d)**Keywords** immunodominance**References** Haglund *et al.* 2002a

- Different HIV strains were used for different regions: Env IIIB, Gag HXB2

- BALB/c mice were vaccinated with rec vesicular stomatitis virus (rVSV) expressing either HIV-1 Gag, Env, or both, and compared to using rec Env and Gag in vaccinia virus (rVVs). The primary response was determined by cell lysis, cytokine production and tetramer staining.
- Primary CTL responses to the immunodominant Env (RGPGRFVTI) epitope peaked 5-7 days after intraperitoneal vaccination with Env-rVSV, 40% of the CD8+ cells were tetramer positive, and this response was 6-fold higher than the response to Env-rVV.
- Vaccinating with GagEnv-rVSV carrying both Gag and Env allowed recognition of both HIV-1 proteins, but at reduced levels compared to either Gag-rVSV or Env-rVSV alone.
- Intranasal immunization with Env-rVSV yielded CTL responses that were strong but reduced compared to an intraperitoneal route.

HXB2 Location gp160 (311–320)**Author Location** Env (IIIB)**Epitope** RGPGRFVTI**Epitope name** p18-I10**Subtype** B**Immunogen** Vaccine*Vector/Type:* vaccinia, vesicular stomatitis virus (VSV) *Strain:* B clade HXB2 *HIV component:* Env, Gag**Species (MHC)** mouse (H-2D^d)**Keywords** immunodominance**References** Haglund *et al.* 2002b

- Different HIV strains were used for different regions: Env IIIB, Gag HXB2
- BALB/c mice were vaccinated with rec vesicular stomatitis virus (rVSV) expressing either HIV-1 Gag or Env, or both, and retention of memory responses and recall responses were studied by tetramer staining and IFN-gamma production.
- Seven months after vaccination with Env-rVSV, 6% of the CD8+ cells were tetramer positive for the immunodominant Env epitope; these cells had a memory phenotype, CD44-Hi positive.
- Env in rec vaccinia virus (Env-rVV) elicited a strong recall response, with up to 45% to the CD8+ T-cell population tetramer positive and activated (expressing CD62L-Lo), and capable of IFN-gamma production.
- A prime with Env-rVSV and heterologous boost of Env-rVV gave remarkably high levels of memory cells, with approximately 1/3 of the CD8+ splenocytes being Env specific memory cells 150 days after the boost.
- A Gag-rVSV or EnvGag-rVSV prime and with a heterologous Gag-rVV or EnvGag-rVV boost combination gave 40% tetramer positive CD8+ cells, but the fraction of IFN-gamma producing cells was only about 25%. Still the heterologous vector prime-boost combination showed a profound benefit.
- A HIV-1 protein rVSV prime, rVV boost was a more potent combination than a vector reversal of a rVV prime and rVSV boost.

Vector/Type: peptide *Strain:* B clade IIIB
HIV component: V3 *Adjuvant:* Cholera toxin (CT), GM-CSF, IL-12, IL-18, IL-1 α

Species (MHC) mouse (H-2D^d)

References Staats *et al.* 2001

- Cholera toxin (CT) is a potent adjuvant used in animal studies that is not safe in humans, so combinations of cytokins were used in nasal immunization of BALB/c mice V3 peptides to attempt to replace CT as a potent adjuvant.
- Peptide vaccine induced CTL activity was significantly increased by IL-1 α , IL-18, and GM-CSF given alone as adjuvant, but CT gave more potent CTL activity than any single cytokine.
- Combinations of cytokins could be more potent than CT as an adjuvant. The highest tetramer binding of H-2Dd peptide-specific PBMC after nasal immunization was observed with IL-1 α plus IL-18 as adjuvant.
- Nasal immunization with HIV peptide in the presence of IL-1 α , IL-12 and GM-CSF induced IFN- γ -secreting cells in the cervical lymph node, the lung and the spleen, and was associated with upregulation of MHC class II and B7.1 on nonlymphocytes in NALT/nasal mucosal cells.
- Consistent results were obtained for the IIIB and the MN peptides.

- A codon optimized gag DNA vaccine was compared to a myristylation defective gag and p24 alone, both of which lack signals for secretion from transfected cells. Gag-derived immunogens that were secreted as VLPs and those that remained intracellular (p24) each produced strong CTL responses, and

neither the size of antigen nor cellular trafficking and localization significantly influenced the strength of humoral and cellular immune activation. The formation and release of VLPs was not essential for eliciting strong CTL. BALB/c mice were given the DNA vaccine by i.m. administration of plasmid DNA for the prime and boost.

- Linking the region encoding the V3 immunodominant epitope to the gag gene did not diminish the response to the Gag p24 epitope A9I, but did enable a response to the V3 epitope.
- Minigenes were made incorporating just one epitope, mini-topes, carrying one of three murine class I epitopes linked to the Ad2-E3 protein-derived signal peptide to allow access of the epitope to the ER. Weak induction of cellular immune responses was observed, in contrast to the complex polyprotein.

- An HIV-1 Env vaccine was targeted for rapid cytoplasmic degradation.
- The rapidly degraded form rapidly stimulated CTL to this peptide, faster than the normal vaccinia-env.
- The rapidly degraded form also stimulated greater specific CTL lysis and higher CTLp frequencies than normal Env.
- Similar results were obtained for a Nef protein designed for rapid degradation.

Species (MHC) mouse (H-2^d)
Keywords vaccine-specific epitope characteristics, immunodominance
References Vázquez Blomquist *et al.* 2002

- BALB/c mice were vaccinated with a polyepitope V3 vaccine in a fowlpoxvirus carrying concatenated 15 mer sections of the V3 loops of HIV-1 isolates LR150, JY1, RF, MN, BRVA and IIIB with 5-aa linkers between, fused to the N-term of p64K protein from *Neisseria meningitidis*.
- Intraperitoneal immunization elicited the strongest V3-specific IFN-gamma response in splenocytes, compared to intravenous and subcutaneous immunization. Intraperitoneal immunization conferred protection in a recombinant vaccinia virus challenge model.
- The immunodominant response was directed against the IIIB peptide (the IIIB immunizing peptide was SIRIQRGP-GRFVFI, the peptide used to probe the response by Elispot was GPGRFVFI).
- Low CTL responses were also detected to the LR150 (SR-GIRIGPGRILAT) and RF (RKRTMGPRVYTT) peptides, no responses were detected to the JY1 (RQSTPIGLQ-ALYTT), BRVA (RKSITKGPRVIYAT), or MN (RKRIHIGP-GRFYTT) peptides.

Species (MHC) mouse (H-2^d)
Assay type cytokine production, CD8 T-cell Elispot - IFN γ
Keywords Th1
References Gómez *et al.* 2004

- Priming of mice with DNA-TAB vector, a polyepitope string carrying 8 different V3 loop sequences, followed by a booster with VV-TAB or MVA-TAB, induced humoral responses, as well as a CD8+ T-cell response against V3 epitopes from three different subtype B HIV isolates. The highest values of specific CD8+ T-cell response were achieved when priming with DNA-TAB and a DNA vector expressing IFN-gamma, followed by a MVA-TAB boost. The T-cell response was Th1.
- The eight V3 loops were linked with an A-G-G-G-A sequence. The three peptides that elicited a response were LR150, SRGIRIGPGRIL; MN, RKRIHIGPGRFY; and IIIB, SIRIQRGPGRFVFI. These peptides were located at the beginning, middle and end of the polyepitope, indicating all parts were able to be processed. It is not known if there is an H-2d epitope in the other five V3 loop variants that did not elicit a response.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, immunodominance, escape, kinetics, characterizing CD8+ T cell responses, reversion, viral fitness

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.
- WEAU had a reaction to an epitope within this peptide, and there was very rapid accumulation of substitutions; variation continued through the last sample collected.

Species (MHC) human (B*5101)

Keywords inter-clade comparisons, rate of progression

References Tomiyama *et al.* 1999

- HLA-B27, -B51, and -B57 are associated with slow progression to AIDS, while HLA-B35, -B8, -B24 are associated with a rapid progression to AIDS (Nat. Med. 2:405, 1996; Lancet 22:1187, 1986; Hum Immunol 22:73, 1988; Hum Immunol 44:156, 1995)
- 15% of Japanese populations carry HLA-B51 while HLA-B27 and -B57 are detected in less than 0.3%
- Of the 172 HIV-1 peptides with HLA-B*5101 anchor residues, 33 bound to HLA-B*5101, seven of these peptides were reactive with CTL from 3 B*5101 positive individuals, and six were properly processed.
- Four of the six epitopes were highly conserved among B subtype sequences, LPCRIKQII is not conserved.

HXB2 Location gp160 (416–424)

Author Location gp160 (416–424 LAI)

Assay type CD8 T-cell Elispot - IFN γ , Flow cytometric CTL assay
Keywords rate of progression, escape
References Geels *et al.* 2003

- Both stable potential epitopes and epitopes with escape mutations were found in a patient with increasing viral load over a time period of 4 years. Fixation of escape mutations occurred sequentially and correlated with the rise in viral load and with the increased number of productively infected cells.
- This is one of 17 potential epitopes from this individual, defined based on previously identified epitopes presented by appropriate HLA molecules. Full length genome sequence did not reveal changes in time in any of these epitopes over a four year period. Peptide pools initially revealed very little response to these epitopes, but this increased over time.

Species (MHC) macaque
References Barouch *et al.* 2000; Shen & Siliciano 2000
- Different HIV strains were used for different regions: SIV-mac239 Gag and HIV-1 89.6P Env
 - Monkeys that received the DNA vaccines augmented with IL-2/Ig were infected when challenged with pathogenic SHIV-89.6P, but had potent CTL responses, stable CD4+ T-cell counts, preserved virus-specific CD4+ T-cell responses, low to undetectable viral loads, and no evidence of disease or mortality by day 140 after challenge – monkeys that got a sham vaccine had high viral load, progressed to disease, and were half were dead by day 140.
 - IL2/Ig consisting of interleukin-2 (IL-2) for immune stimulation, and the Fc portion of immunoglobulin G (IgG) for stability, was delivered either as protein or as DNA – both enhance the CTL response to vaccination, DNA IL2/Ig giving the most intense response.
 - Responses to a dominant Mamu A*01 gag epitope SIV Gag p11C (CTPYDINQM) and a subdominant epitope HIV-1 Env p41A (YAPPISGQI) were tracked and had good durability prior to challenge, and the higher the prechallenge peak p11C CTL response, the lower the post-challenge viral load.

- No NAb responses were detected in the vaccinated monkeys prior to challenge, and comparable peak NAb titers developed in vaccinated monkeys and control monkeys with preserved CD4+ T-cells.
- Shen *et al.* 2000 is an accompanying commentary.

Keywords vaccine-specific epitope characteristics, rate of progression, kinetics, memory cells, characterizing CD8+ T cell responses

References Davenport *et al.* 2004

- Activation and expansion of antigen-specific CD8+ T-cells shows a delay following infection that allows early viral replication. Until day 10, the kinetics of CD8+ T-cell expansion was the same in vaccinated and control macaques. An increase in virus-specific CD8+ T-cell numbers around day 10 in vaccinated macaques coincides with a slowing in viral replication. This indicates that while cytotoxic T-lymphocyte-inducing vaccines may have a long-term benefit in controlling viral replication and preventing disease progression, they cannot prevent infection.

Keywords dynamics, acute infection, characterizing CD8+ T cell responses

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape mutations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

Epitope FLGFLGAAGSTMGAASLTTLTVQARC

Immunogen HIV-1 infection

Species (MHC) human (Cw7)

References Nehete *et al.* 1998a

- Three long-term non-progressors and one asymptomatic HIV+ individual were studied and found to have HLA class I C-restricted CD8+ Env-specific CTLs – Cw7 specific CTL were found against three peptides, including this one.
- HLA-C antigens are expressed on lymphoid cells to a lesser extent, 10% of either HLA-A or HLA-B.
- HLA-C confers protection against lysis by natural killer cells and by non-MHC-restricted effector T cells and Cw7 directly governs this resistance to lysis – the authors hypothesize that pathogens that inhibit antigen expression and class I expression may particularly down regulate Cw7, thus triggering non-MHC restricted killing.

Country South Africa.
Assay type CD8 T-cell Elispot - IFN γ
Keywords cross-presentation by different HLA, characterizing CD8+ T cell responses
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Species (MHC) human, transgenic mouse (A2)
Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay, Flow cytometric CTL assay
Keywords binding affinity, inter-clade comparisons, computational epitope prediction

References Corbet *et al.* 2003

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This peptide was a good A2 binder, and induced CD8+ T-cell IFN gamma responses in mice. Responses to the peptide were not detected in 17 HIV+ HLA-A2 subjects.

HXB2 Location gp160 (565–573)
Author Location Env (731–739)
Epitope LLQLTVWGI
Immunogen HIV-1 infection
Species (MHC) human (A2 supertype)
Keywords supertype, rate of progression
References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind four of the five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802).

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay
Keywords dynamics, immunodominance, escape, acute infection, characterizing CD8+ T cell responses, reversion, viral fitness
References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient BORI had high viral loads and rapid CD4 decline. BORI mounted 8 detected responses. BORI did not control viral replication well, and escape mutations occurred early and in most epitopes, 6/7 that were precisely identified.
- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Eleven variants in the ERYLKDQQL epitope were found in the patient BORI. ERYLKeQQp came up first at day 17 from onset of symptoms, but wasn't tested for escape properties. ERYLrDQQL came up next, by day 31, but didn't confer escape in a Cr release assay. By day 218, three variants were found, all of which gave a diminished response: ERYLtDQQL, ERYLqDQQL, and ERYLsDQQL. By day 556 a complex mixture was present, also including the ERYLmDQQL variant that gave a further reduction in the response, and many double mutants: ERYLmDQrL, ERYLmDrQL, ERYLmDQIL, ERYLtDQrL and ERYrtDQrL.
- In SUMA, the only variation found in the 24 epitopes was in three overlapping epitopes in Tat, and in this gp160 epitope; variation accumulated early in infection in the Tat epitopes, but this epitope was stable until a sample 736 days post-infection, when only the ERYLqDQQL variant was detected. This variant was not tested with CTL from SUMA, but gave a diminished response in BORI.

Epitope ERYLKDQQL

Immunogen HIV-1 infection

Species (MHC) human (B14)

Keywords early-expressed proteins, kinetics

References Guillon *et al.* 2002b

- An early-expressed Nef protein was modified to contain Env and Pol epitopes to enable the study the effect of expression kinetics on CTL mediated suppression of replication. The "EpiNef" construct was inserted into a recombinant vaccinia virus which was used to infect a target cell line; the target cells were lysed by CTL clones specific for the Env and Pol epitopes indicating that they were properly processed.

Author Location gp41 (584–592)

Epitope ERYLKDQQL

Immunogen HIV-1 infection

Species (MHC) human (B14)

Keywords class I down-regulation by Nef

References Yang *et al.* 2002

- Nef down-modulates class I protein expression, and this study demonstrates directly that Nef-deleted HIV-1 NL-43 can be more effectively killed *in vitro* than NL-43 with an intact Nef. The effect was shown to be specific for class I presentation of epitopes, and unlike Nef, deleting Vpr did not alter CTL susceptibility of NL43 infected cells. The CTL clone 15160D75, specific for the class I B14 presented epitope ERYLKDQQL, was one of four used in this study.

Epitope name B14-EL9(gp41)

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B14)

Donor MHC A32, A?, B7, B14

Keywords HAART, ART, supervised treatment interruptions (STI)

References Altfield *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.

- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.

- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.

- Treatment interruption following HAART resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.

- Breakdowns of epitope responses were shown for 4 individuals. Patient A displayed the greatest response to epitope B14-EL9(gp41), a strong response to B7-TL9(p24), and responses to B7-TM9(Nef) and A32-PW10(RT).

Epitope ERYLKDQQL

Subtype A, B, C, D

Immunogen HIV-1 infection, Vaccine

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade
HIV component: p17 Gag, p24 Gag

Species (MHC) human (B14)

Keywords inter-clade comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFNgamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

- Epitope** ERYLKDQQL
Epitope name Env EL9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B14)
Assay type Chromium-release assay
Keywords binding affinity, TCR usage, characterizing CD8+ T cell responses
References Yang *et al.* 2003b
- Killing efficiency of CTLs and their ability to suppress viral replication is shown to depend more on epitope specificity than to antigenic avidity. Different clones recognizing the same epitope had similar killing efficiency despite their variation in avidity. Nef specific CTL clones tended to be most inhibitory, followed by Gag, then by RT specific clones, regardless of avidity.
 - 4/14 CTL T-cell clones tested were specific for Env EL9. Under conditions of excess peptide (100ug/ml), there was no difference in their lytic potential; all possessed similar effector capacity. Avidity was measured as the sensitizing dose of peptide required for 50% of maximal killing (SD50), which varied from 20 pg/ml to 100 ng/ml, over four orders of magnitude for all 14 epitopes. The SD50 range for Env EL9 was 5,000 - 60,000 pg/ml.

Keywords binding affinity, acute infection, early-expressed proteins
References Cao *et al.* 2003
- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
 - All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
 - More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

Assay type CD8 T-cell Elispot - IFN γ
Keywords characterizing CD8+ T cell responses
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Assay type CD8 T-cell Elispot - IFN γ

Keywords acute infection, early treatment

References Montefiori *et al.* 2003

- HIV-1 + patient AC10 underwent early HAART treatment, which was discontinued 1.5 years later. At this timepoint potent NAb responses against autologous virus were detected. Treatment interruption initially induced weak CD8+ responses directed against 5 epitopes. By days 873d and 923d the CTL response had broadened to target 22 epitopes; of these six were fully characterized. Eventually the virus escaped the NAb response, but escape was not accompanied by a rise in viral load, and the authors suggest the virus was contained by the CTL response.

References Kaul *et al.* 2001a

- Variants (R)YL(R/K)DQQLL are specific for the A/B clade.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.

- Among HLA-A24 women, 3/4 HEPS and 10/10 HIV-1 infected women recognized this epitope, and (R)YL(R/K)DQQLL tended to be reactive in HEPS and infected women, RDYV-DRFFKTL in infected women only.
- The dominant response to this HLA allele was to this epitope in all 3/4 HEPS cases but in only 4 of the 10/10 HIV-1 infected women.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.

- Three long-term non-progressors and one asymptomatic HIV+ individual were studied and found to have HLA class I C-restricted CD8+ Env-specific CTLs – Cw7 specific CTL were found against three peptides, including this one.
- HLA-C antigens are expressed on lymphoid cells to a lesser extent, 10% of either HLA-A or HLA-B.
- HLA-C confers protection against lysis by natural killer cells and by non-MHC-restricted effector T cells and Cw7 directly governs this resistance to lysis – the authors hypothesize that pathogens that inhibit antigen expression and class I expression may particularly down regulate Cw7, thus triggering non-MHC restricted killing.

HXB2 Location gp160 (594–608)

Author Location gp41 (SF2)

Epitope GIWGCSGKLICTTAV

Epitope name Peptide2

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B17(57))

Assay type Chromium-release assay

References Carmichael *et al.* 1996

- Cross-reactivity of Env-specific CTL clones from 14 seropositive HIV-1 infected patients was tested using peptides based on 3 B clade variants (MN, IIB, and RF). The proportion of CTL clones that cross-recognized conserved variants was low. Most CTL clones recognized only one peptide variant, indicating most Env responses are not cross-reactive within the B clade.
- This HLA B17(57) epitope was newly identified within gp41 of HIV-1 SF2. SF2 and IIB have identical sequences within this peptide, but the T-cell clone that recognizes this peptide does not recognize the MN (gFwgcs-gklicTtTv) or RF (giwgcs-gklicTtTv) variants of this peptide.

HXB2 Location gp160 (594–608)

Immunogen HIV-1 infection
Species (MHC) human (B35)
Donor MHC A3, A33, B14, B35, Cw*0401, Cw0802
Assay type CD8 T-cell Elispot - IFN γ
Keywords binding affinity, acute infection, early-expressed proteins
References Cao *et al.* 2003
 • All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
 • All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.

- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

HXB2 Location gp160 (606–614)

Author Location Env (96–104)

Epitope TAVPWNASW

Immunogen HIV-1 infection

Species (MHC) human (B35)

Country Spain.

Assay type proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric CTL assay

Keywords HAART, ART, supervised treatment interruptions (STI), immune dysfunction

References Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load.
- 5/9 patients recognized this epitope.

HXB2 Location gp160 (634–648)

Author Location gp41 (641–655 SF2)

Epitope EIDNYTNTIYTLLEE

Immunogen HIV-1 infection

Species (MHC) human

References Lieberman *et al.* 1997a

- Of 25 patients, most had CTL specific for more than 1 HIV-1 protein.
- Eleven subjects had CTL that could recognize vaccinia-expressed LAI gp160.
- One of these 11 had CTL response to this peptide.
- The responding subject was HLA-A1, A2, B51, and B57.

HXB2 Location gp160 (678–686)

Epitope WLWYIKIFI

Subtype B

Immunogen Vaccine

Vector/Type: protein *Strain:* B clade MN
HIV component: gp160

Species (MHC) human (A2.1)

Keywords binding affinity

References Kundu *et al.* 1998a

- Ten HIV-1 + HLA A2 asymptomatic individuals were given two courses of HIV-1 MN rgp160 vaccine over a 2 year period.
- Two hundred and fifty three HIV-1 peptides of 9 or 10 aa possessing the HLA-A2.1 binding motif (Leu at position 2, Val at the C terminus) were identified in gp160, of which 25 had a high or intermediate binding affinity.
- Eleven peptides were studied that had high HLA-A2 binding affinity – a CTL response was detected to 9/11 peptides in at least 1 individual.
- CTL responses after reimmunization may include recall responses – only individuals with vaccine cross-reactive sequences prior to vaccination showed detectable CTL responses.

HXB2 Location gp160 (680–688)

Author Location gp41 (679–687 SF2)

Epitope WYIKIFIMI

Immunogen HIV-1 infection

Species (MHC) human (A*2402)

References Ikeda-Moore *et al.* 1997

- Defined using reverse immunogenetics – 59 HLA-A*2402 binding peptides were predicted by searching for A*2402 anchors in HIV proteins (Tyr at 2, and Phe, Leu or Ile at the C term) – 53 of the 59 peptides bound A*2402.
- This peptide induced CTL in 1/4 HIV-1 + people tested.
- WYIKIFIMI bound to A*2402 strongly, the epitope can be processed in a vaccinia construct and presented – two specific CTL clones were obtained.

HXB2 Location gp160 (681–689)

Author Location Env (681–)

Epitope YIKIFIMIV

Epitope name Env681

Immunogen HIV-1 infection, Vaccine

Vector/Type: peptide *HIV component:* Env
Adjuvant: Incomplete Freund's Adjuvant (IFA)

Species (MHC) human, transgenic mouse (A2)

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay, Flow cytometric CTL assay

Keywords binding affinity, inter-clade comparisons, computational epitope prediction

References Corbet *et al.* 2003

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This peptide was a good A2 binder, and induced CTL and CD8+ T-cell IFN gamma responses in mice. Responses were detected in 2/17 HIV+ HLA-A2 subjects.

Epitope VFAVLSIVNR

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A*3303)

References Hossain *et al.* 2001; Takiguchi *et al.* 2000

- HLA-A33 a very common allele in Asian, with HLA-A*3303 the most common among the Japanese. New A*3303 epitopes were defined to better characterize the immune response in this population.
- The anchor motif for HLA*3303 (A, I, L, V, F, Y in position 2 (F and Y bind most strongly), and R (K is also tolerated) in the C-terminal position) was used to define 82 potentially reactive peptides in Env; 37/82 peptides bound to A*3303; 3/37 peptides could induce peptide-specific CTL in bulk PBMC cultures from 1/3 HLA A*3303 positive individuals tested.
- CTL clones were isolated that killed target cells in a concentration dependent manner after pulsing with the VFAVLSIVNR peptide, that could also kill cells transfected with env expressed from a vaccinia vector. Bulk cultures were tested from six additional people, and only 1/6 reacted with this peptide, but the peptide is in a highly variable region.

Epitope name IY9 (gp41)

Immunogen HIV-1 infection**Species (MHC)** human (A*3002)**References** Goulder *et al.* 2001a

- HLA-A*3002 is very common in African populations, 50% of Zimbabweans express HLA-A30, 44% in African Zulu, so five new HIV epitopes were characterized that are presented by this HLA molecule.
- A rapid method was developed combining ELISPOT with intracellular IFN- γ staining of PBMCs to map optimal epitopes, then HLA presenting molecules were defined – this method was completed within 48 to 72 hours of receipt of blood.
- Two individuals were studied: Subject 199 (HLA A*0201/*3002 B*4402/51 Cw2/5), a Caucasian, and Subject 6007 (HLA A*3002/ B53/*5801 Cw4/7) an African-Caribbean.
- In both HLA-A*3002 individuals the response to RSLYNT-VATLY was dominant.
- In subject 199 four additional A*3002 epitopes were identified.
- Three quantitative assays, ELISPOT, precursor frequency and chromium release, confirmed a hierarchy of response: RY11 (p17) > KY9 (gp41) > KY9 (RT-53) > IY9 (gp41)

HXB2 Location gp160 (742–761)**Author Location** Env (742–761)**Epitope** RDRSIRLVSGFLALAWDDLRL**Subtype** C**Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** inter-clade comparisons**References** Novitsky *et al.* 2002

Immunogen

Species (MHC) human (A*3101)

Keywords optimal epitope

References Frahm *et al.* 2004

- C. Brander notes this is an A*3002 epitope.

HXB2 Location gp160 (770–780)
Author Location gp41 (768–778 NL43)
Epitope RLRDLLLIVTR
Immunogen HIV-1 infection
Species (MHC) human (A3)

Keywords inter-clade comparisons

References Cao *et al.* 1997a

- The consensus peptide of clade B is RLRDLLLIVTR.
- The consensus peptide of clades A, C and E is RLRDFILIVTR and it is less reactive.
- The consensus peptide of clade D is SLRDLLLIVTR and it is less reactive.

HXB2 Location gp160 (770–780)
Author Location gp41 (775–785)

Epitope RLRDLLLIVTR

Immunogen HIV-1 infection, HIV-1 exposed seronegative

Species (MHC) human (A3)

Keywords HIV exposed persistently seronegative (HEPS)

References Kaul *et al.* 2001a

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.

HXB2 Location gp160 (770–780)
Author Location gp41 (770–780)

Epitope RLRDLLLIVTR

Immunogen HIV-1 infection

Species (MHC) human (A3)

Keywords rate of progression, acute infection

References Day *et al.* 2001

- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)

- 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.
- All patients recognized at least 1 A3 epitope, up to 8 A3 epitopes, but none was clearly dominant.

HXB2 Location gp160 (770–780)
Author Location Nef (73–82)

Epitope RLRDLLLIVTR

Immunogen HIV-1 infection

Species (MHC) human (A3)

Keywords rate of progression, acute infection

References Day *et al.* 2001

- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)

- All patients recognized at least 1 A3 epitope, up to 8 A3 epitopes, but none was clearly dominant.
- In two of the subjects, RLRDLLLIVTR was the dominant epitope.

HXB2 Location gp160 (770–780)
Author Location gp41 (769–780)

Epitope RLRDLLLIVTR

Epitope name A3-RR11

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A3)

Donor MHC A3, B7, Cw7

Keywords dynamics, supervised treatment interruptions (STI), acute infection

References Yu *et al.* 2002a

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- 0/14 HLA-A3 positive individuals had detectable A3-restricted responses to this epitope during acute infection, but only 5/15 of HLA-A3 epitopes tested were targeted during acute infection. 1/7 individuals began to have detectable responses to this epitope after STI.

HXB2 Location gp160 (770–780)
Author Location Env (770–780)

Epitope RLRDLLLIVTR

Immunogen HIV-1 infection

Species (MHC) human (A3)

- Donor MHC** A03, A32, B51, B15, Cw03, Cw06, DR4, DR8, DQ7
Country Netherlands.
Assay type CD8 T-cell Elispot - IFN γ , Flow cytometric CTL assay
Keywords rate of progression, escape
References Geels *et al.* 2003
- Both stable potential epitopes and epitopes with escape mutations were found in a patient with increasing viral load over a time period of 4 years. Fixation of escape mutations occurred sequentially and correlated with the rise in viral load and with the increased number of productively infected cells.
 - This is one of 7 epitopes from this individual that varied over time, although the internal mutations did not become fixed. rlrldlllvtr variant residues were found. The V mutation arose at late time points, the I mutation arose at intermediate time points.
- HXB2 Location** gp160 (770–780)
Author Location Env (786–778)
Epitope RLRDLLLLIVTR
Immunogen HIV-1 infection
Species (MHC) human (A3)
Country Spain.
Assay type proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric CTL assay
Keywords HAART, ART, supervised treatment interruptions (STI), immune dysfunction
References Plana *et al.* 2004
- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load.
 - Less than 2 of 14 patients recognized this epitope.
- HXB2 Location** gp160 (770–780)
Author Location gp41 (770–780)
Epitope RLRDLLLLIVTR
Immunogen HIV-1 infection
Species (MHC) human (A31)
References Ferris *et al.* 1999; Hammond *et al.* 1995
- This epitope is processed by a TAP1/2 dependent mechanism.

Immunogen HIV-1 infection
Species (MHC) human (A31)
Donor MHC A*0201, A31, B44, B60, Cw3, Cw16
Assay type CD8 T-cell Elispot - IFN γ
Keywords binding affinity, acute infection, early-expressed proteins
References Cao *et al.* 2003
- CTL epitope responses were mapped in 21 men within 15–92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
 - All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes was characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
 - More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.
- HXB2 Location** gp160 (770–780)

Epitope name KY9 (gp41)
Immunogen HIV-1 infection
Species (MHC) human (A*3002)
References Goulder *et al.* 2001a

- HLA-A*3002 is very common in African populations, 50% of Zimbabweans express HLA-A30, 44% in African Zulu, so five new HIV epitopes were characterized that are presented by this HLA molecule.
- A rapid method was developed combining ELISPOT with intracellular IFN- γ staining of PBMCs to map optimal epitopes, then HLA presenting molecules were defined – this method was completed within 48 to 72 hours of receipt of blood.
- Two individuals were studied: Subject 199 (HLA A*0201/*3002 B*4402/51 Cw2/5), a Caucasian, and Subject 6007 (HLA A*3002/ B53/*5801 Cw4/7) an African-Caribbean.
- In both HLA-A*3002 individuals the response to RSLYNT-VATLY was dominant.
- In subject 199 four additional A*3002 epitopes were identified.
- Three quantitative assays, ELISPOT, precursor frequency and chromium release, confirmed a hierarchy of response: RY11 (p17) > KY9 (gp41) > KY9 (RT-53) > IY9 (gp41)

Immunogen Vaccine

Vector/Type: protein *Strain:* B clade MN
HIV component: gp160

Species (MHC) human (A2.1)

Keywords binding affinity

References Kundu *et al.* 1998a

- Ten HIV-1 + HLA A2 asymptomatic individuals were given two courses of HIV-1 MN rgp160 vaccine over a 2 year period.

- Two hundred and fifty three HIV-1 peptides of 9 or 10 aa possessing the HLA-A2.1 binding motif (Leu at position 2, Val at the C terminus) were identified in gp160, of which 25 had a high or intermediate binding affinity.
- Eleven peptides were studied that had high HLA-A2 binding affinity – a CTL response was detected to 9/11 peptides in at least 1 individual.
- CTL responses after reimmunization may include recall responses – only individuals with vaccine cross-reactive sequences prior to vaccination showed detectable CTL responses.

References Kundu *et al.* 1998a

- Ten HIV-1 + HLA A2 asymptomatic individuals were given two courses of HIV-1 MN rgp160 vaccine over a 2 year period.
- Two hundred and fifty three HIV-1 peptides of 9 or 10 aa possessing the HLA-A2.1 binding motif (Leu at position 2, Val at the C terminus) were identified in gp160, of which 25 had a high or intermediate binding affinity.
- Eleven peptides were studied that had high HLA-A2 binding affinity – a CTL response was detected to 9/11 peptides in at least 1 individual.
- CTL responses after reimmunization may include recall responses – only individuals with vaccine cross-reactive sequences prior to vaccination showed detectable CTL responses.
- CTL to overlapping peptides in this region gave a positive response in the greatest number of patients.

- ALTERNATIVE EPITOPES: LLNATDIAV and LLNATDIAVA – CTL were induced by vaccine in those that had the sequence SLLNATAIAVA in their own infection, but not in those with: NLLNTIAIAVA or NLFNTTIAIAVA or SLLNATAITVA.

Epitope SLLNATDIAV

Epitope name LR27

Subtype B

Immunogen Vaccine

Vector/Type: peptide *Strain:* B clade LAI

Adjuvant: Incomplete Freund's Adjuvant (IFA), Montanide (ISA 720), P30, PLG

Species (MHC) mouse (A2.1)

Keywords binding affinity, vaccine-specific epitope characteristics, immunodominance

References Peter *et al.* 2001

- The stability of peptide binding to HLA-A2.1 was determined for six HLA-A2.1 peptides included in this vaccine study – ILKEPVHGV (RT), SLYNTVATL (p17), SLLNATDIAV (gp41) and LLWKGEGAV (RT) all bound with high affinity comparable to a influenza epitope reference (GILGFVFTL), while RGPGRFVFTI and VIYQYMDDL bound with a lower affinity (relative binding activity = 0.01).
- The four high-affinity peptides formed stable complexes with half-lives ranging between 8 and 32 hours, while the low affinity peptides had half lives of less than an hour.
- HLA-A2.1 transgenic mice were immunized with the six HIV-1 peptides and P30, as a universal T-helper epitope, with IFA or Montanide or microspheres as adjuvants.
- All peptides except VIYQYMDDL induced a strong CTL response in Cr-release assays - stronger responses were observed when peptides were delivered alone, indicating immunodominance when the combination was used.

Immunogen Vaccine

Vector/Type: peptide *Strain:* B clade LAI

Adjuvant: Incomplete Freund's Adjuvant (IFA), IL-12, P30

Species (MHC) mouse (A2.1)

Keywords vaccine-specific epitope characteristics, immunodominance

References Peter *et al.* 2002

- When HIV-1 peptides were used to vaccinate HLA-A2.1 transgenic A2-Kb mice, strong responses to five peptides were observed when the peptides were given individually, but immunodominance limited the response to some of the peptides when they were given in combination Peter *et al.* [2001]. IL-12 can counteract immunodominance in BALB/c mice, so it was given with the multiple epitope vaccination, and was instead found to specifically eliminate the HLA-A2.1-epitope CTL responses, but not Kb CTL responses. This was possibly a consequence of transient depletion of T-cells, B cells and macrophages in the spleen.

Epitope SLLNATDIAV

Epitope name gp41 SV10

Immunogen HIV-1 infection

Species (MHC) human (A68)

Keywords binding affinity, inter-clade comparisons, supertype, computational epitope prediction

References Altfeld *et al.* 2001c

- HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested.
- Three additional previously described HLA-A2 epitopes were added to the set of 20, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2)
- This epitope binds to three HLA-A2 supertype alleles: A*6802 (highest affinity), A*0202 and A*0203 (but not A*0201 and not A*0206)
- This epitope did not elicit an ELISPOT response in 22 chronic HIV HLA-A2 infections, but elicited a strong response in 1/12 acute HLA-A2 infections – this individual, AC13, was HLA A*0201/68 B44/14 and also had a strong response to HLA-A2 vpr epitope AIIRILQQL.

Keywords binding affinity

References Kmiecik *et al.* 1998a

- CTL responses in six patients to four Env epitopes were studied: D2: LLNATAIAV, 5.3: RLRDLLIV, D1: KLTPLCVTL, and 4.3: QMHEDIISL—all have A2 anchor residues.

- The C terminal epitopes (D2 and 5.3) were highly variable and the variability was considered responsible for limited CTL response, while D1 and 4.3, N-terminal epitopes, were much more conserved and gave evidence of high levels of CTL response *in vitro*.
- Peptides 5.3 and D2 bound to HLA A*0201 with low affinity and were variable, particularly D2.
- Substitutions in peptide D2: IlnTIAiav did not abrogate the response, but diminished it.
- In a longitudinal study, the CTL response to the variable D2 epitope diminished over time, while the response to the conserved epitope D1 stayed higher.

Keywords characterizing CD8+ T cell responses

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analysed in African patients. Significantly greater number of responses were shown to be HLA-B restricted. Viral load, CD4 count and so the rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.
- This was one of five reasonably strong responses in early infection in the patient WEAU, and the epitope sequence did not vary during the first year of the infection.

- HLA-A33 a very common allele in Asia, with HLA-A*3303 the most common among the Japanese. New A*3303 epitopes were defined to better characterize the immune response in this population.
- The anchor motif for HLA*3303 (A, I, L, V, F, Y in position 2 (F and Y bind most strongly), and R (K is also tolerated) in the C-terminal position) was used to define 82 potentially reactive peptides in Env; 37/82 peptides bound to A*3303; 3/37 peptides could induce peptide-specific CTL in bulk PBMC cultures from 1/3 HLA A*3303 positive individuals tested.
- 2/3 peptides that reacted with the bulk culture, EVAQRAYR and VIEVAQRAYR, were overlapping, with one encompassing the other, but EVAQRAYR was shown to be the one that was reactive with a CTL clone.

- CTL clones were isolated that killed target cells in a concentration dependent manner after pulsing with the EVAQRAYR peptide, that could also kill cells transfected with env expressed from a vaccinia vector. Bulk cultures were tested from six additional people, and only 2/6 reacted with this peptide, but the peptide is in a highly variable region.

References Hay *et al.* 1999

- CTL response to IPRRIRQGL was the immunodominant response in a rapid progressor – there was a subdominant response to SPAIFQSSM in Pol, and interestingly, no response to commonly immunodominant HLA A*0201 epitope SLYNT-VATL, although this individual was HLA A*0201.
- The individual showed a strong initial CTL response at the time of the initial drop in viremia, but it was quickly lost, although memory cells persisted.

- Despite the initial narrow response to two epitopes, no other CTL responses developed.
- No HIV-specific lymphoproliferative responses were detected in this patient, and neutralizing antibody response was weak.
- Variants were observed *in vivo*, the most common form of the viral epitope at presentation at 3 months was the only form that did not elicit a CTL response: iprrTrqgl; the other forms detected were iprrirqgF, iprrLqgF, VprrirqgF and they could elicit a CTL response although the response to iprrLqgF was reduced.
- A second rapid progressor had a detectable CTL response exclusively to this epitope.

Species (MHC) human (B7)

Keywords HAART, ART, acute infection

References Altfield *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-B7+ individuals that had a CTL response to this epitope broken down by group: 2/4 group 1, 1/3 group 2, and 1/1 group 3.

Epitope IPRRIRQGL

Immunogen HIV-1 infection, HIV-1 exposed seronegative

Species (MHC) human (B7)

Keywords HIV exposed persistently seronegative (HEPS), immunodominance

References Kaul *et al.* 2001a

- IPRRIRQGL cross-reacts with clades A, B and D.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B7 women, 2/5 HEPS and 5/6 HIV-1 infected women recognized this epitope.
- The dominant response to this HLA allele was to this epitope in 2 of the 5/6 HIV-1 infected women that responded to the epitope, but in neither of the 2/5 HEPS cases.
- Subject ML 1203 started with CTL responses to A*6802 DTVLEDINL and to B7 FVPVTPQVPLR prior to seroconversion, and upon seroconversion acquired additional responses to A*6802 ETAYFILKL which became dominant, B7 TPGPGV/IRYPL, B7 IPRRIRQGL, and B7 SPRTLNAWV.

Epitope IPRRIRQGL

Immunogen HIV-1 infection

Species (MHC) human (B7)

Keywords rate of progression, acute infection

References Day *et al.* 2001

- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)
- 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.
- Subjects with chronic HIV-1 infection recognized between 2-8 out of 11 B7-restricted epitopes.
- An acute seroconverter homozygous for the B7 allele recognized five B7-restricted epitopes.
- The other acute seroconverter failed to recognize any of the 11 B7-restricted epitopes tested.
- The B7-restricted CTL response was highly variable and there was no clearly dominant epitope.

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B7)

Donor MHC A3, B7, Cw7

Keywords dynamics, supervised treatment interruptions (STI), immunodominance, acute infection

References Yu *et al.* 2002a

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- Only two epitopes were detected during acute infection in patient AC-06, B7 restricted gp41 epitope IPRRIRQGL and Gag GPGHKARVL. GPGHKARVL was the first targeted peptide, and remained immunodominant through the 34 month study period.

- 6/11 HLA-B7 individuals had detectable B7-restricted responses to this epitope during acute infection – 10/15 of HLA-B7 epitopes tested were targeted by at least one person during acute infection. 2/4 individuals had detectable responses to this epitope after STI.

Immunogen HIV-1 infection

Species (MHC) human (B7)

Donor MHC A24, A?, B7, B27

Keywords HAART, ART, supervised treatment interruptions (STI)

References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient C displayed the greatest response to B27-KK10(p24), and in decreasing order also responded to A24-RW8(Nef), B7-IL9(gp41), A24-RL9(gp41), A24-YL8(gp41), and B7-TM9(Nef).

Epitope IPRRIRQGL

Epitope name EW10

Immunogen HIV-1 infection

Species (MHC) human (B7)

Assay type Chromium-release assay, Flow cytometric CTL assay

Keywords class I down-regulation by Nef

References Bobbitt *et al.* 2003

- Nef, through Nef-mediated MHC-I down-regulation, is not the only viral protein to influence levels of HIV-specific CTL recognition. The Rev L60F mutation, a common natural variant, can decrease CTL recognition of late gene products. The Rev mutation impacts the early to late gene switch, reducing late gene product production (Gag, Pol, Env, Vpu, Vpr and Vif), while increasing Nef production, both of which reduce the

impact CTL recognition of late gene products. As expected, Rev L60F rendered HIV infected cells more resistant to CTL that recognized epitopes from the late proteins Env and Gag. Gag expression is reduced more than Env, and Gag-specific CTL were more profoundly affected. Conversely CTL against an epitope in an early gene product, Tat, were more efficiently recognized when infected with viruses carrying the Rev L60F mutation.

- Patients in the asymptomatic phase with active immune responses had more CTL resistant viruses, with lower Rev activity, lower Gag expression and greater resistance to Gag-specific CTL killing, while viruses isolated from people with AIDS were more sensitive to CTL killing.

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B7)

Donor MHC A1, A3, B7, B14, Cw*0702, Cw*0802

Assay type CD8 T-cell Elispot - IFN γ

Keywords binding affinity, acute infection, early-expressed proteins

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Immunogen HIV-1 infection

Species (MHC) human (B7)

Country Netherlands.

Assay type CD8 T-cell Elispot - IFN γ

Keywords HIV exposed persistently seronegative (HEPS)

References Koning *et al.* 2004

- A high-risk seronegative group of 29 homosexual men showed reduced cellular in vitro susceptibility for HIV infection and enhanced production of RANTES compared to 15 men who went on to seroconvert. Significantly higher frequencies of HLA A*11, A*31 and Cw*15 were also found in the high risk seronegative men. Both groups of men had low frequencies of HIV-1 specific CD8+ T-cells, which may signify exposure more than protection from infection.
- 3/9 HLA B7+ infection-resistant men, compared to 0/4 pre-seroconversion men who went on to become infected, reacted to this epitope.

Epitope IPRRRIRQGL

Immunogen HIV-1 infection

Species (MHC) human (B7)

Country Spain.

Assay type proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric CTL assay

Keywords HAART, ART, supervised treatment interruptions (STI), immune dysfunction

References Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load.
- 3/7 patients recognized this epitope.
